Terminal programs you'll want include BobTerm of course, and FlickerTerm sounds cool when it comes out, and I bet (IF ITAY'D FINISH IT!) Ice-T will be pretty cool too (I HOPE!). Also, yeah, Kermit-65 if you need it, and probably some 'better-than-BobTerm' VT-100 emulator (BobTerm only does VT-52, ASCII, ATASCII).

For text readers, get the new 5.12 version of TextPro, I've not seen T:Edit yet, and COL80 by Itay is hella nice for 80 column if you have a good monitor (or can stand getting used to 3-bit fonts).

For music demos, go for The BIG Demo by HTT if you can stand lots of scrollers (THERE'S a 60K, 3-HOUR LONG SCROLLER IN THAT SUCKER!). Also, most of the (newer) Hobby demos (like 1990 and on) and of course the HALLE demo. (HEY! IS THERE A 1994 HALLE DEMO!?!?!?) Oh, and YourBody is pretty cool.. as is the dancing silouette portion of Veronika.

Finally.. as for a good graphics viewer - get JVIEW! I wonder if it's at UMICH yet? (THanx again Jeff for resending me a copy.. I have a backup of the ARC and I promise this time I won't erase it! :))

Oh - and back to cool programs - don't forget MODPlay 1.22 (I couldn't get FAMPY to work! Besides - I'd rather keep original files around versus 8-bit specific files - that way I can upload stuff and get UL/DL credits at local BBSes! hehe!)

Anyways - good luck!

I simply had an opportunity to upgrade from my Hayes Ultra v.32
Smartmodem (9600) to a Hayes Ultra v.32bis Smartmodem (14.4k).

Right now, it maxes out at 19.2k on my Atari - but I can get above 38.4k on
my PC, but since it's physcially connected to my Atari, my PC will have
to do with the old Hayes Ultra 9600 v.32! [grin]

Priorities, you know!

I'm in the market to purchase an Atari 800 ram upgrade kit.

Dont know ANYTHING about existing ram upgrades for the 800, but I do know
I'd like to do something with this brand new 800 sitting
here!

Eventually, I'll add it as a MUX slave.

Glen,
Thanks for the info on chroma-luma. Even tho I don't know which pins go to which audio plugs, I am happy that one of them produces reasonable 80 column output with Omnicom on a green monitor. The Radio Shack clerk said that 2 pairs of pins went to 2 of the audio plugs and the fifth pin to the third plug. So could someone use a y-adapter to combine chroma and luma into one rca jack that would be usable say in thecase that began this thread?

>
>Rod

Rod,
Who wrote the 8bit emulator for the ST?
Derek something?????
Is he out here?
More to the point: Is there an 8bit Atari emulator for MS Windows?
I miss my old games but dont want to play with the old hardware.
If Derek coded an emulator for the 68000/GEM an 486orP5/MS Win 3.11 (4.0)
version would be great!
Bill

I have an MIO setup with an XEP-80 and HD system that I have tried to run at high speeds and with the XEp, it just bogs down. Bobterm will easily handle a 19.2 connection in 40 col mode, but at 80 col, it drops characters throughout the document.

Many times users want to capture the text for later reading, or have a high speed connection for doing file transfers. Therefore, it's an inconvenience to say the least, to have to run two configs of Bobterm just to run at high speed.

The XEP-80 was fine with 2400 baud, but above that, it becomes a problem. Personally, I always hoped that someone would create the 80 column board for the MIO (my unit has the connectors already in place).

3070. Re: 800XL vs. PC

Newsgroup: comp.sys.atari.8bit

Source record: 100650

It's nice to see a familiar name here. I've just gotten access to Internet and am playing around trying to find stuff.

I saw your message about the advantages of the 8bit vs the PC. Just thought I would throw in my two cents.

I started out with a TI 99/4A (still have it) added an 800xl, built to 256k with 30 meg HD on an MIO and XEP-80. Also added an Apple II+, Laser 128 (IIe clone) and finally a Laser XT. I still have all except the Laser XT which was sold when I upgraded to a 386. SOld the 386 and upgraded to a 486/33. That's where I'm at right now, with 4 systems set up as well as a BBS (currently 8 bit PRO but will be on an ST in the next week or so).

I have found that the 8bit was very capable but eventually it became limited in what it can do. Your comment about Atariwriter is fine for you but I had greater needs. I put out the newsletter for the TI user group and it consisted of printing, cutting, pasting, etc. I tried using the 8bit (I have Newsroom, Newstation and a few other publishing programs) but they just took too much time.

Now I have Ami Pro on the PC. Yes, it takes lots of hardware, lots of memory, and costs more than Atariwriter (but not that much more... I paid $150 for the entire SmartSuite with AmiPro, 123, Freelance, Approach and Organizer). I can now put together a much better looking, more readable, and cleaner newletter in about 1/5 the time. I feed the document to a Stylus 800 printer and it's done.

I caution you judging the PC by the 8088/86 era. At that time, it was inferior to the 800xl line in many respects. But those days are 10 years in the past. Capabilities are far increased. And the prices are not that far out of line.

486 PCs with monitor and 200meg HD are available for $900.
My 800xl cost $100, the disk drive $125, the monitor was $249, the MIO cost $250, the RAMBO was $69, the HD was $75 (old PC stuff).

Personally, I'm glad the prices are staying where they were when I started this hobby, and moreso that the capabilities are increasing so dramatically.

3071. Help!! broken disc drive

I've recently digged out my old atari 8 bit system (800XL 1050? disc drive etc). Much to my dissapointment the 1050 refuses to work. When I plug it in and turn on the system, the drive just 'whirrs' continuosly. Is this a common problem, does anyone know if there is an easy fix, or do I have to go looking for a new one?

I also heard there was a 8-bit emulator for the ST- is it any good, also is there one for the PC.

System lock-up bug has been fixed, when the clock updates from 12-31-99 to
the year 2000. Plus, the day of the week in TDLINE will be correct now
after the year 2000. For those of you that are going to use their machines
this long, it shows FTe's long term hopes. :-)

I have a question about the clock; what are the chances of getting one
which works with PAL (49.9something Hz) machines? The current one
loses ten seconds to the minute, which isn't particularly useful :)

Also, does the R:Time cartridge have its own crystal, or does it rely
on the system clock? If the latter, it will have the same problem as
TDLINE :(

Me too, as I am one of the authors :-)))

I was just browsing through some of the newsgroups that I've never read before and this brings back some of the good old memories...

|>
|> >And while I'm at it, anyone have ANY idea what it was about? My German
|> >isn't all that good, and it seems to have a plot involving a helicopter
|> >on some kind of psychadelic nightmare about toilets, showers,
|> >telephones and bouncing balls, accompanied by a creepy "thong, thong..."
|> >kind of noise. A funny people, the Germans. :)

Well, the idea was somehow to collect all the keys in the big labyrinth, and to open the doors (using the keyholes of the same colour). Having opened the last door (level 1 has one door, level 2 two doors etc.), you have to free the other imprisoned Nadral by kissing (nice sound) him (her? it?).

We had lots of fun designing the whole thing (we did this during the last year of school), but I agree that the game is somewhat unplayable and boring, but the effects are nice.

I assume that you have a cracked copy of this game. No problem with that. I think that in this case you'll miss one of the technically interesting things we did for this game:

We spend a lot of time designing the intro trailer to the game. I think that there is no other game on the 800 the loads the game, plays music and scrolls the screen and moves a "Nadral" sign (made of four playes from the P/M set) *at the same time*.

|> Got me there. Don't forget the cigarette lighters and the toggle switches.
|> It seemed like a vaguely "Shamus"-like game, but a lot weirder (and I
|> kind of liked it!) Also, the fact that it used digitized speech was
|> unique. Something like "speiler ein... schluB" when you died. The sound
|> effects were good also, using nice decay effects on the volume to make them
|> sound more realistic.

The speech was "Spieler eins ... Schluss" (player one, finished).

Ahh, the good old memories. Sometimes, when I'm in my hometown, I dig out my old 130 XE, hook up the disc drive and play a round of Nadral, or

Highway Duel, the other game we wrote...

I'm holding onto my old Atari 800 and peripherals. someday they will be antiques. Besides, it has sentimental value to me...the first computer I ever bought. By working with it, and reading all I could about it, I learned enough to get started in the software industry. If my father hadn't loaned me the money (which I repaid with wages from a summer job) for it, I wouldn't be where I am today.

Message-ID: <9406131501.AA16388@phinet.smithkline.com>
Source record: 100654

****

The following letter was posted in hardcopy to the DGS News-Paper on
June 13, 1994:

Dean Garraghty, Editor
D.G.S. News-Paper
62 Thomson Avenue
Balby, Doncaster
ENGLAND DN4 0NU

Sir:

In the editorial on page 3 of issue 18 of the News-Paper it is stated that Atari Classics magazine "has been offered to a user group based in California. ... Offering it to a user group is, in my opinion, not a good idea." The impressions created by these statements are not indicative of the facts. Please permit me to set the record straight.

Atari Classics was founded upon the results of a worldwide user-sponsored mail campaign which was organized in late 1991 and completed in the spring of 1992. The publication was intended as a serious effort which required a minimum of 500 subscribers to be financially viable, a fact which campaign respondents were informed of. About 1700 direct mailings were made, from which 615 positive responses were received. It was on the basis of those 615 positive responses (115 in excess of the campaign committee's goal), that I was asked by the committee's chairman to undertake the business foundation of the magazine. Under my management AC published nine issues (including four software disks), eight of which were undersubscribed.

AC was in effect a contract between the campaign committee and the user community which was clearly spelled out in the campaign literature, of which the essence was "Give us your support and we'll give you a magazine". The committee delivered on virtually all of its promises, but the community failed to honor its end of the bargain. It was on the basis of declining support from the very community which spawned the publication that the decision was made in early 1994 to shut it down. (This is not meant as criticism of the community, it is merely a statement of fact. It is my opinion that the abandonment of the 8bit platform was already in a fatal accelerating tailspin even during the period when AC was starting up, and that process merely continued-- with devastating effects even among the ranks of people who participated in the mail campaign and initially supported the magazine. Correspondence from former subscribers in response to mailouts of renewal forms clearly shows a pattern of migration to other platforms, mainly the PC.)

In stating that AC was "offered" to other parties you imply that the essential elements of any serious publication, i.e. its subscriber list and treasury, were hawked to the highest bidder. No such thing ever occurred. Because I view the failure of AC as a breach of the contract between the campaign committee and the community, it was always my feeling that the resources of the enterprise should be dissolved and dispersed back to the community. During the chaotic early months of 1994 I was approached by no fewer than three parties, all with strong ties to commercial interests, who expressed interest in acquiring the resources of Atari Classics. I was appalled at the cavalier manner in which these interests viewed AC, with utter disregard for the uniqueness of its origin. I informed all these parties, in no uncertain terms, that the demise of AC was not going to be an opportunity for a feast by commercial vultures at the expense of the magazine's paid-up subscribers.

During that same period I was approached by Mr. Bob Woolley, of the San Leandro Computer Club (SLCC) in California. Mr. Woolley strongly supported the mail campaign in 1992 and continued supporting the magazine in 1993-94 as a member of its Staff. Like me, he was distraught by the prospect of AC's impending demise and wanted to explore ways of saving it. From those discussions there emerged two realities with conflicting elements: 1.) the original concept of AC as formulated in 1991 and delivered in 1992 is untenable and should be dissolved; 2.) enough support might still exist to make it desirable to conduct a referendum on continuing the AC idea, albeit under a more modest/compact business environment. The present policies of AC are aimed at satisfying both of these objectives.

The following items represent the true facts concerning AC:

1.) The publication called Atari Classics ceased publication as of May 1994.
2.) The operational organization (staff) of the magazine have been dismissed.
3.) The financial resources of the magazine are in process of being dispersed back to the community (first batch of refund checks mailed out 6/12/94).
4.) The primary resources of the publication (its treasury and subscriber list) have not been offered or transferred to anyone.
5.) An entirely independent effort, led by Mr. Jim Hood of the SLCC group in California, is underway to revive the AC concept in the form of another magazine. The new publication may, or may not, be called Atari Classics (it probably will be, though).
6.) In addition to being current president of SLCC, Mr. Hood is also a professional graphic artist who operates a hobby magazine with an established base of 6,000 subscribers. Publishing being his livelihood, AC will not be either an amateur effort or a part-time concern for him (as it was with me).
7.) The final (April) issue of AC assisted Mr. Hood's effort by publishing a new subscription form and unedited material submitted by him as a sample of the flavor of his proposed new publication. The response he receives will constitute the desired referendum to loyal readers on the AC concept.
8.) Permission has been granted for the new publication to use as much of the intangible assets (magazine name, logo, features, policies, etc.) of the old magazine as it deems appropriate. This request was granted in response to expressions of desire on the part of Bob Woolley and Jim Hood

that the "new" AC should maintain as much identity and continuity with the "old" AC as possible.
9.) It will be up to the new magazine's management to assemble a staff, build their own subscriber list, and manage their own treasury. I am serving in an advisory capacity to that effort but am not actively participating in it.
10.) During its existence AC derived 90% of its support from readers in the US and Canada. While the UK/European market may equal the US/Canadian market in number of users, the proportion of those users able/willing to buy a subscription is significantly lower. Insofar as my activities stem directly from a mandate by the community of loyal AC supporters, I take very seriously my obligations to that community, to act in their behalf. To offer the resources of AC to any party in the UK/Europe, especially one with obvious commercial interests, was simply unthinkable.
11.) In an editorial in issue 17 of the News-Paper, it was stated that "We are now the only Atari publication that offers some form of payment for submissions." It should be pointed out that AC always paid a $25 cash stipend to authors of major feature articles (the last author payment was mailed in May) and gave a 2-issue extension to subscriptions of readers who submitted minor articles. This policy will be continued by Jim Hood in the "new" Atari Classics.
12.) Alan Hitchen's reference (on page 10 of issue 18 of the News-Paper) to "The sad news about the demise of Atari Classics..." is premature. AC *the magazine* may be defunct, but AC *the concept* is not. Let us first see how many subscription orders are received by Jim Hood before we plan the funeral. Rather bad form, to be already digging the grave while the corpse is still warm and twitching.

Respectfully submitted,

Benjamin L. Poehland
Managing Editor
ATARI CLASSICS Magazine

3076. AC Refunds Going Out

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-13 15:24:46 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9406131506.AA16826@phinet.smithkline.com>
Source record: 100555

I just wanted to let everyone know the first batch of AC subscription refund checks went into the mail yesterday. These were all to people whose last name starts with "A". (We still have a long way to go!)

This first initial run, things are going kinda slow as we work out the details of actually doing. For the moment it looks like we'll be averaging about 30 checks per week, but I'm confident that rate will go up to around 50/week once we go into high gear.

As usual with such things, the logistics of doing this are just hideous. I live in dread fear of of getting the checks & preaddressed envelopes out of order while I'm stuffing envelopes, which would cause dozens of checks to get mailed to the wrong people (!). But so far the process is moving along about as well as can be expected, & with vigilance hopefully we won't have any major FUBARs.

It isn't often a magazine folds up & the subscriber gets a refund, accompanied by a signed letter from the Managing Editor thanking the readers for their support.

- Ben Poehland
Managing Editor
ATARI CLASSICS Magazine

Source record: 100556

Hey Ben. I must applaud your efforts with _AC_. I feel pretty bad that I never got a chance to resubscribe ($25 is a lot to someone who has $5 at most at any given time - that's for lunch and bus fare!), but perhaps now that I have a job I'll subscribe to the 'new' _AC_ and see if I can get back issues of 'old' _AC_.

Anyways, I've heard the horror stories about ANTIC and ANALOG (actually, I heard most of those stories back when _AC_ was being created) and I feel the community of us 8-bitters should all give you (and the rest of 'old' _AC_'s staff) a big warm "THANKS!" because of the effort still going on after the magazine is already 'dead'!

Also, that reply to News-Paper was (as always) VERY well written! :)
(sorry, I'm not a good writer, especially when it comes to business-type stuff, so I'm usually pretty impressed with good writing)

Thanx for keeping AC from turning into another ANTIC/ANALOG :)
-bill

3078. 160 x 192 x 64

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-13 19:46:05 UTC
From: ericl@bert.cs.byu.edu
Message-ID: <ericl.771536765@bert.cs.byu.edu>
Source record: 100557

In a message explaining the capabilities of the Atari 8-bits, the author (sorry, I forget his name) mentioned that a graphics mode with 160 x 192 resolution with 64 "true" colors is possible. I am familiar with the technique of using display list interrupts to cht and get more colors on the screen than is normally possible, but I was wondering how it would be possible to get 64 colors (unless you assigned four new colors to each line of the screen, which would give you as many colors as you wanted) and what he meant by "true" colors.

3080. 4464 DRAMs

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-13 22:07:49 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9406132152.AA11322@phinet.smithkline.com>
Source record: 100558

My junkbox keeps turning up weird DRAM effluvium. This past weekend I came across a ton of 4464 DRAM chips. These are 256K, organized 4x64K.

I know of only 2 uses for these things: in the 64K upgrade for the 600XL, & they are also used in the YORKY. (BTW, you need to upgrade your 600XL to 64K for it to work with YORKY.) The YORKY uses 6 of these, the 600XL takes 2, for a total of 256K.

I've also seen these on some video cards used in PC's.

Anybody seen these used in any other 8-bit stuff?

Anyways, I'll sell them for 40-cents apiece in lots of 20 if anybody wants some. Dunno why I got *so* many, maybe I had some fantasy of cornering the 4464 market someday or something.

- Ben Poehland

3081. 800XL vs. PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-13 22:38:45 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9406132203.AA11817@phinet.smithkline.com>
Source record: 100559

James Payton mentioned about the disadvantage of using 8bits vs. PC's because of the crummy video display.

In comparing my "souped-up" 800XL based system to an IBM XT, one of the items I failed to list was that my system has all the Super Video upgrades, which cost maybe all of $3.00 to install & produces super-sharp video, especially in mono. My comparison between the Atari & IBM was on the basis of all things being more or less equal, which means a regular composite mono monitor for the Atari & MDA/TTL monitor for the IBM.

I haven't used a TV set for a monitor since 1984 & never looked back. No TV can ever compare to a monitor. And no stock 1200XL or 800XL can compare to the SV modified XL machines. The crappy video in the XL's wasn't a characteristic of Atari 8bits, it was a stupid Atari design flaw that is readily rectified.

I gather James doesn't know about the XEP-80. Ataeri *DID* release a hardware based 80-column mode, & it works quite well. It appeared around 1987 I think. With a simple modification the XEP80 can be made to work with a TTL monitor for maximum video clarity. I think the output of an XEP80 in either CV or TTL mode is on the same level of quality as a Hercules/MDA PC card produces. And for good measure it is also possible to modify the XL to output 40-column TTL video. All this stuff was described in the December 1993 Atari Classics.

With so many excellent choices for 8bit video these days there's really no reason anyone would *want* to use a TV (unless that's all you have).

There's been a lot of discussion in this group about the Super Video upgrades, but I haven't seen one message from anyone who uses a TTL monitor employing the Woolley upgrades from AC. Anybody out there using TTL?

I spent considerable time messing with the TTL XEP-80 upgrade (per my comments on Woolley's article in AC) but never got around to doing the 40-column TTL upgrade. I'd be curious to know if anyone did that hack & what they think of it. Maybe a stumbling block for most people is the fancy switch you need to switch back & forth from 40-col to 80-col mode with the TTL monitor. Ah, let's see, there 4 main signals in TTL, right? (H, V, I & Vid) Which means you'd need a 4PDT switch? Wonder if Radio Shack sells such a switch? I think they do....

: (sorry, I forget his name) mentioned that a graphics mode with 160 x 192
: resolution with 64 "true" colors is possible. I am familiar with the
: technique of using display list interrupts to cht and get more colors
: on the screen than is normally possible, but I was wondering how it
: would be possible to get 64 colors (unless you assigned four new colors
: to each line of the screen, which would give you as many colors as you
: wanted) and what he meant by "true" colors.

: -- Eric

The 3 CV pages are primary color separations. The luminance info of red,
for instance, is broken down into 4 evenly separated brightnesses of red,
and so on.

The atari has a palette of way over 64 colors, but in CV15 the colors are
simulated by "mixing" the 3 DLI bars in the cycling sequence.

Thus, a bright primary red would be a red bar, then 2 black sequences
because there is no blue or green info.

Colors are thus "additive".

A byproduct of this in CV9 is a puplish hue to the background. Adjusting
the monitor to boost contrast improves CV9 images immensely, because the
CV process seems to reduce contrast, I don't know why.

3084. 1200XL on TV!

From: tdrake1@umbc.edu
Message-ID: <2tj22l$qlu@news.umbc.edu>
Source record: 100563

On the 25th of May 1994 I was channel surfing on the cable and came across the Mr. Wizard's World program on Nickelodeon. The title for this episode of Mr. Wizard's World was "What's This?"

The first item he showed was the Atari 1200XL 8-bit computer! He was explaining how computers worked and actually took the top off of the 1200XL!

Mr. Wizard also showed the 1200XL playing PacMan with the help of his young assistance at the controls of a genuine standard Atari joystick!

Mr. Wizard even took the joystick apart and had his assistant play PacMan using only the bubbles.

I was amazed! Using the 1200XL to demonstrate how computers work! What an outstanding choice!

Did anybody else see this episode of Mr. Wizard's World?

Message #2239 on Atari 8Bit

From -----> FRANK WALTERS
To -------> ALL
Date -----> 05-29-94
Subject --> Atar-Z-Modem 1.2
-=-
Larry Black has just released version 1.2 of his Atar-Z-Modem, Zmodem receive protocol for Atari 8bits. It fixed a few minor bugs in v.1.0 and added a couple features that could be helpful. It is Shareware, so please support Larry in his continuing effort to suport 8-bit Atari users. He can't say anything about this as he is the echo moderator of this echo. I imagine he was very disappointed in the total lack of response to his initial release of the first Zmodem receive program for the Atari. Doesn't anybody send registrations for new Shareware anymore? Or do authors have to offer "Crippleware" that require you to register it to get it to fully function. I hate those programs and never register them.

Summary of changes in Atar-Z-Modem 1.2:

1. Fixes minor bug in Filename block CRC routine.

2. Fixes memory conflict between buffer and P:R: Connection ROM hander when that handler was installed by v1.0. Did not affect P:R: disk file handlers or 850 interface.

3. Filename is verified for alpha/numeric characters only, as required by Atari DOS 2.5. Lower case converted to upper case and illegal characters replaced with "Z" character in receiver's "save" file.

4. RESUME function added. Allows user to resume downloading a partial file that was previously aborted for any reason. Time limitation when resuming very long files on very slow disk drives due to necessity to read and Open to append the partial file before beginning data transfer.

ATZMOD12.ARC is around 20k and can be downloaded from my BBS, TACO Bell, between 4pm-11pm Central time. Phone: 904-785-2333. New callers must use Atari translation and have full privileges on first call. It can be File requested (FREQ) from Larry's FidoNet system, The -< Bejue >- Bbs 904-769-9688 (1:3608/121). It will be made available on GEnie and Compuserve by the end of this week.

* TEXTPRO 5.16 * Atar-Z-Modem 1.2 now includes "Resume" function.

In particular: Re: QWK8 needing 64k or 128k

Well Glenn :) for one, you'd think the AUTHOR of QWK8 would know what he was talking about when he said 64k! And secondly.. since when do you need 128k to unARC something!? I do it all the time! (and btw - I tested out UNARC24.COM on the 8bit with a RAMdisk in MyDOS versus ARC.EXE on an IBM 8086-based machine with a (relatively slow) Hard drive and for some reason I was SURPRISED to see UNARC24 go faster! :))

Anyways, unless you mean something else about the ARC'd up QWK packets that I don't know!?

BTW- I tried out PABQwk and didn't like it (and it died on the QKW packet I fed it) and I used SLMR on my IBM PS/2 and it's pretty cool I guess, but the BBS that I planned on using offline-readers with is running the DCQWK Door on a T.A.G. BBS and the Door is unregistered, and although our sysop sent the author money and FINALLY got the 'secret register code', it was wrong - and then the guy disappeared! :) UGH
I may try messing with QWKSilver (is that it?) and QWK8 just for fun, but have no real use for either or SLMR until this sysop can find a good offline reader Door.

3087. 3D Poly rendering (REALTIME) on 8bits

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-14 01:50:50 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940613185102.23416345@sonoma.edu>
Source record: 100565

HELP! I'd like to see what type of FAST 3d poly rendering is possible with the Atari 8bits. I'd like to do the code in Action! without floating point (perhaps CARDs which are 10 or 100 times higher in resolution than a Graphics 7 screen .. surprisingly enough, this works rather well to 'fake' a FP-calculated 3D-ish image!)

The specifics of what I'd like is some simple, zoom-in/out-able, fly-around-able 3D poly (I'd kill for solid sides, but who'm I kidding for realtime rendering at 1.79mHz!? :))

The specific shape that I'd like is fortunately a simple one. It is comprised of a base which is a triangle and a point at the other end. Like a 3-sided (instead of square-based) pyramid.

I think some 3D starfields I worked on for fun a while ago could be converted to handle a 3D shape, but they're not as easily stick-controlled as I want.

Anyways.. thanx in advance! Also, does anyone know of a good Internet newsgroup to ask stuff like this in (seems a bit more appropriate, but I'm actually more interested in some nice canned Action! code than some damned cryptic uncommented C crap.. I mean code :))

>luck... I hope so!

Of the several hundred programs I have in my library, about 40 of them
don't like SpartaDOS. Out of those 40, about a dozen don't like to be on
anything other than an Atari DOS 2.0/2.5 disk; the rest are content to
live on SmartDOS double density disks.

: 128k to unARC something!? I do it all the time! (and btw - I tested out

PKARC defaults to use the more advanced compression scheme. I forget whether it is called squeeze or squash. That mode can only be uncompressed with SuperArc or SDX (I don't know if SDX uses extended RAM to do so). SuperArc will use the extended ram as a lookup table. It does so without prompting so not many people realize it is doing it. But if you try unarcing a .QWK packet with a 64K machine and it needs to use the extended ram to unsqueeze/squash then it WILL prompt you to tell you you are screwed.

The board I used to use for Fido would ALWAYS use the advanced compression scheme. I can't say ALL do, but I bet most of them do.

SuperARC can not create .ARCs using that particular advanced .ARC scheme, so when unarcing files created with SuperArc or I guess the SDX arc you will NEVER need 128K. This is why many people are in the dark that you need 128K often when unarcing files created by 16/32 bit machines.

3092. Super Products

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-14 02:58:02 UTC
From: mperry@cairo.anu.edu.au
Message-ID: <mperry.771562682@cairo>
Source record: 100570

A few people have asked me about the Super Products stuff so I'll post this again.

I have had SuperMax in my 1050 for about a year and don't think I could go back to a standard 1050.

Now, I have SuperMon in my XEGS. So far I have not really used the monitor functions. Not having to use the translator disk anymore is great. You only need to flick a switch to get the 400/800 Rev. B OS instead. The other great thing is that it works with cartridges too. Millipede just does not work quite right on an XL or XE but now I can battle the swarms again with no problems by flicking the switch.

Those people who like their 800's may be interested in Super800. This will most probably be the next thing I get - plus SuperRAM to give me plenty of memory. The only disadvantage I can see is no parallel bus so I would want a hard disk interface that connects to the serial IO bus. No one has done this yet have they?

Super Products

SUPERMON
Replaces the XL operating system with the Atari Rev. B OS. This will allow XL and XE computers to run 400/800 software without using the translator disk. It gives you a powerful disassembler which is always available. All disassembler functions such as disassemble, step, trace, change move etc are available. You can also access the disk drives (eg binary loader without DOS). You can also use a 4 colour screendump which will even do some redefined character set graphics or any mixture of modes.

SUPERAM
Using SuperRAM you can get 256K for your XL (both 600 and 800), 304K in your 800 and 320K for your XE. SuperMon can access this memory with any of it's functions. No soldering is required on the 600 or 800XL and the 800 needs only one connection.

SUPERMAX / SUPERDOS
SuperMax gives you true double density on your 1050, as well as a fourfold increase in the read/write speed (with SuperDOS or other hi speed DOS). To add SuperMax, you need to remove a chip (and replace it with SuperMax), cut a few traces and solder a wire or two. SuperDOS is smaller than Atari DOS, easier to use and has many extra features such as a binary loader that leaves you with 707 free sectors on a disk. SuperDOS is now available on the Atari archive site.

SUPER800
Super800 will allow your faithful 800 to run all those special XL

programs. If used with SuperRAM, you can also emulate the XE running programs such as Paper Clip, AtariWriter Plus etc. Contains two operating systems, both with SuperMon and 16K of RAM. It can use SuperRAM as Axlon or XL compatible RAM. It comes on a single plug in board which is easy to install.

SuperMon, SuperRAM, SuperMax and Super800 can all be switched off with the system returned to normal if the need arises.

Super Products stuff is available from James Bradford.

WOW!!!!!!!!!!!!

Let me get this right now.... With the SUPER800 combined with the
SuperRAM, are you saying that us 800 owners can run XL/XE software to
include the 64K XL/XE only software with no problems??

Does that mean that this upgrade would essentially turn an 800 into an
800XE equivalent??

Say more....Are there any limitations? I am sure that there are a number
of old 800 owners like myself who would be interested!!

Source record: 100573

Well, the DD3 print previewer I've heard of is for SpartaDOS only and I think it needs you to set up your DD3 Print Processor with a certain type of file.

Anyways, a DD3 print previewer is simple - it'd be like any other print previewer - it would understand printer codes and display stuff as graphics on the screen - even things like text (this is especially good for proportional text like on XMM801 and other printers).

As long as the program understood all of the printer's codes (at least the ones for graphics), you'd be able to view any printed graphics that you'd be able to redirect to file (ie, set the printing to D: instead of P:)

3097. Help! BAD CRC errors

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-14 07:50:08 UTC
From: gtkakega@thunder.LakeheadU.Ca
Message-ID: <2157@thunder.LakeheadU.Ca>
Source record: 100581

Why is it that everytime I FTP (binary mode) an 8-bit file (.ARC, .DCM) from atari.archive.umich.edu, I'm always ending up with a 'BAD CRC' (ARC) or a 'bad bytes' (DCM) error when attempting to dearchive on my 8-bit?

What I do is FTP from a PC, then I use Charles Marslett's UTIL program to transfer the file (with the binary switch) to an Atari floppy. What can go wrong? I use Bob Puff's Super Unarc v2.4 and Disk Communicator v3.2.

Any help would be appreciated.

Hello Atari freaks!

Is there anyone who know something about assemblers for the powerful W65C816
CPU wich runs on a ATARI 800/130XE with or without a W65C816?

This time I've only a table-driven assembler for IBM compatible PCs. But this
assembler is very poor.

Bye,
Mario

Bill,

Yes, it was for SpartaDOS only. It only required that you printed
one page ata a time, to disk. So does anyone have this program?
I don't want to write it again.

jeff

|> here, or at the CSS BBS, or CTH BBS. Can somebody help me?

Hehe...I not only have the original program, I've inherited the Action!
source to it. It was called "Daisy Dot Pal", originally by Charles Blaquiere
(Blaq!). It had the flaw of only working with Sparta DOS, only loading one
file with one filename, and only being compatible with Epson printer codes.
I have modified it to work with either Sparta or MyDOS, allowed you to enter
the filename you wish (after viewing a directory), and allowing RAMdisk use
(by moving the vital display area out of the $4000-$7FFF bank). I didn't
think anyone much was interested in it any more. I can try to get it
uploaded somewhere convenient.

>My comparison between the Atari & IBM was on the basis of all things being more
>or less equal, which means a regular composite mono monitor for the Atari &
>MDA/TTL monitor for the IBM.

So with the Atari you have to choose a monochrome display or a color
40-column display. With an 8088 you could get a used VGA color display
dirt cheap - you aren't forced to choose between color and 80 columns.

>I haven't used a TV set for a monitor since 1984 & never looked back. No TV
>can ever compare to a monitor. And no stock 1200XL or 800XL can compare to
>the SV modified XL machines. The crappy video in the XL's wasn't a
>characteristic of Atari 8bits, it was a stupid Atari design flaw that is readily
>rectified.

Today I use a composite color monitor for my 800 and a SVGA display
for my PC. Regardless of what kind of upgrades are available for the
XLs, I doubt that they could make *that* much improvement. :-)

>I gather James doesn't know about the XEP-80. Ataeri *DID* release a hardware
>based 80-column mode, & it works quite well. It appeared around 1987 I think.
>With a simple modification the XEP80 can be made to work with a TTL monitor
>for maximum video clarity. I think the output of an XEP80 in either CV
>or TTL mode is on the same level of quality as a Hercules/MDA PC card produces.
>And for good measure it is also possible to modify the XL to output 40-column
>TTL video. All this stuff was described in the December 1993 Atari Classics.

I've been reading this group for a year, so I have heard of it. :-)
My opinion of it? Too limited, too little, too late. If Atari would
have implemented an 80 column COLOR and MONOCHROME display earlier (and
it should have been standard in any machine built after the 400/800)
there could have been much more software support.

>With so many excellent choices for 8bit video these days there's really no
>reason anyone would *want* to use a TV (unless that's all you have).

The reason that I responded to your post is that you stated the
Atari makes a better computer than an 8088, and that 8088 users
would be better off with an 8-bit. Sorry, but I don't agree.

Don't get me wrong, I think the Atari is a great machine. But if
I could only have *one* computer and had to choose between it and
an 8088, I'm afraid I would have to choose the 8088.

The advantages of having a PC compatible have become too great:
cheap hard drives, VGA monitors and cards, plug in high-speed modems
and printers. A lot of used equipment is practically given away.
Sure some of these options can exist on an Atari, but the solutions
and are messy and expensive. I don't think your average 8088 owner
who uses the machine for word-processing and telecommunications would
find *any* advantage in using an Atari 8-bit.

As I stated before, it depends upon the application. If the computer
is going to be used mostly for entertainment, then I would agree that
the Atari wins hands-down.

: So a 64K .QWK system is kinda impossible.

I have worked with QWK style packets and the QWK structure for awhile now, it is very possible to have 64K, and probably less, RAM and view QWK packets. OLX, for the IBM, has over 200K free, the reason is that it doesn't load all of the messages into memory, it loads them when you read them, since the machine is so fast you hardly ever realize it. It is a very disk intensive program, which is how it would have to be if you have 64K or less RAM, and you would notice it on a 1.79MHz computer. So it is very possible to write and run a QWK packet reader with 64K. Now you come into a problem where how many features the QWK reader has, and you have to a reasonable size buffer to hold the message, otherwise you will have to load a message in several parts, 8K is usually more than enough, but there are guys out there (you know who you are :)...) that write pretty long messages.

>I have load of old XL disks, is there any way of reading them on a PC
>(not emulating) just reading them and transferring the files to 3 1/2
>inch disks so I can use them on my FALCON (while emulating the 8bit).

Perhaps not the way you want to. If you use MYDOS or SpartaDOS you can
use DOS programs like UTIL to read 8-bit Atari disks with your PC, but you
have to be working with at least 180K Single Sided/Double Density disks.
Commercial software only comes on 90K SS/SD, or sometimes 128K SS/ED disks.
But for any files you can copy, you can copy them to 180K disks (assuming
you have a drive capable of this), and use UTIL to read them on your PC.

Tim,

I've done this mod. It appeared in a REAL early Antic or Analog
(I don't remember which). I used it with a composite monitor
(before my 400 blew up) and its output was as good as my 800.
If you're interested in the reference I could try to look it up
over the next little while.

You could unarc the ARC files on the PC. That way you'd know if the
files themselves are bad, or if they're being corrupted by the transfer
to 8-bit disks. Are you using a 1.2 meg drive on the PC? You might need
to use a 360k drive (do they still make them?)

14.4 Kbps is done using CCITT V.32bis, the fastest international standard
available for modems today. The next standard will be V.34, and will be at
28.8 Kbps. 19.2 Kbps may be popular, but there is no CCITT standard at
that speed.

3109. R: handler speeds

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-14 23:22:42 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940614162251.234152f6@sonoma.edu>
Source record: 100589

I was asked how fast a BBS program I wrote can go. Well, I actually don't know!

Here's the setup:

RS232 handler must be installed ("R:" can be opened)
It can receive a speed byte (ie, 10 = 1200 baud)
It can read/write bytes via CIO (PUT/GET) calls
It stores buffer sizes in the 740 (dec) range in memory (ie, like the SX212, and I guess 850, and I guess everything else)

The software closes R: every time it does disk access, but before that makes sure the buffer has been sent completely (a bug which took me quite a while and quite a few BBS tries to figure out! hahah! UGH!).

The software doesn't support file I/O (if it did, it would be an external program) and multiple drives.

Anyways, other than those things, I don't think many other details need to be posted for someone to give me an answer to: How fast can it go?!
Will I be able to connect an R:P:Conn or BB and a REEEALLY fast modem!? Will those modems allow users to call in at LOWER speeds than whatever my fastest is (or will I need to do something with my program to handle that? - actually.. I think I will for when DOORs are spawned! oops! :))

thanx

There is a bare bones one that Chuck Steinman of DataQue made for the T816.

MAE from John Harris has more features and does support the '802 and '816
well from what I've gathered on GEnie.

Chuck also has a cross assembler he was using, I don't know much about that.

3112. Re: 800XL vs. PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-15 03:18:42 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Bo2M-j6.lmcclure@delphi.com>
Source record: 100591

In a message dated 6-13-94, Ben Poehland said:

"let's see, there 4 main signals in TTL, right? (H, V, I &
Vid) Which means you'd need a 4PDT switch? Wonder if
Radio Shack sells such a switch? I think they do...."

Actually, since TTL monitors use a DB-9 connector, one could simply purchase a standard DB-9 A-B switchbox and use that.

These are a bit rarer in these days of hi-density DB-15 VGA/SVGA monitor connectors, but you can still find them in the pages of Computer Shopper. For example, in the July issue, Computer Gate International has one on page 451 for $8.95 (order #SB9502). Well, actually that's a keyboard + monitor switch (the keyboard socket being a DIN-5). Cables America on page 441 of the same issue will see you an A-B switchbox with just DB-9's for $7.95 (order #126784).

I wonder if anyone has considering using the TTL XEP-80 upgrade to create a "one monitor" solution? The TTL upgrade would also work with RGBI monitors. There are a number of monitors out there (such as the Amiga 1080 and Thompson 4120 monitors I have) that handle composite, separated video, and RGBI (and RGB analog, which no 8-bit standard or modifidied output yet uses). With a TTL-mod'd XEP-80 hooked up to the RGB port, and the 40-column output plugged into the chroma/luma inputs, one could use a single monitor for both, switching with the selector switch (which is behind the front panel on my 1080 and 4120).

Another bonus is that with a little additional circuitry, one could have their choice of colors for the 80-column RGB screen (i.e., yellow for text, with a blue background). Of course, if you wanted to settle for say, white on blue, that would be even easier. (Tie the intensity and blue lines high, and feed the TTL output from the XEP-80 into the green and red inputs).

Whenever I finally make enough room to set up my desk with my Atari 1200XL again, I will have to give this one a try.

3113. Re: 80 Columns on the 8bits...

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-15 03:19:31 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <BK+M357.lmcclure@delphi.com>
Source record: 100592

In a messaged dated 6-13-94, Glenn M. Saunders said (about the XEP-80 character set):

"No, it is ATASCII."

I was going by some of the interview in the 8-bit Atari mags that brought up the subject of the XEP-80, before it actually came out. Evidently, this was another case of what Atari talked about not be exactly the same thing we got.

I wonder what the chances either CO34702 or CO37403 in the XEP-80 are ROM chips, and that either contain the character set bit-map (as opposed to be it being integrated into the microcontroller or other chip)? If in a standard 28-pin ROM, replacing it with an EPROM with a new, appropriate character set would not be a problem.

As to the throughput problem, any changes in how communication was handled with the XEP-80 would require a rewrite of its driver software, and any software that addresses it directly. Off hand, I wonder if the parallel port could be modified to recieve data, rather than send it. Of course, even if so, making use of this would require the A8 to use some form of parallel output (i.e., using BOTH joystick ports, adding a second PIA, or using the parallel printer port of the a Black Box or MIO). Naturally, the latter two essentially preclude bidirectional communication, but since new software would be required anyway, this should not be an insurmountable problem.

Of course, by this time, one must ask "Why even use the XEP-80"?? About the only reason I can think of would be, "Because its there". <grin>

3114. Re: 4464 DRAMs

Newsgroup: comp.sys.atari.8bit

Ok.. JView is an EXCELLENT program. I got a few pre-made .RGB's which were produced with JView and they look wonderful (except the version of CSView I have doesn't do CV8).

Now, I'm sure that .GIF's have got to be >THE< most common graphic type nowadays, but you (Jeff Potter) have had experience with other graphics formats, right? Like .IFF. Now, with some of the talk about modular programs that's gone on around here (and in my Email), it came to me that you could create a module which is pretty much everything JView does EXCEPT the .GIF decoding. That is, process a screenful of Red/Green/Blue data into dithered (or non-dithered) ColorView data. From that modular program, one could load a GIF-decoding module and all of a sudden they have a program which is pretty much identical to JView as it is. Or, they could load an IFF-decoding module (are the routines involved in decompressing IFF's smaller or bigger than those which do .GIF's?). Or they could even one day (if the Atari 8bits ever get it) load up a JPG-decoding module!

As JView stands, it requires 64k with the 16k under the OS being free. Subtract 24k for the actual ColorView screen (actually, more like 22k). Subtract some amount which Jeff pretty much is the only person who knows for the menus, the I/O routines, and the (NICE!) true-pixel -> ColorView-pixel conversion. Then, that will leave the amount of space available for actual file decoding routines. So far it's been proven enough for a GIF.. why not other graphics formats?

Anyways.. just an idea. >I< think it'd be pretty cool.

And with JPG's becoming so popular, well, we may just need it..
(either that or some stand alone program which does JPG -> GIF !?)

3116. Second Post looking for Atari Magazines

Hello and thankyou for reading this post.

As stated in my previous and very long :(post I am desperately seeking
Atari magazine sources, Programming books, technical documents, etc.
anything to do with programming the Atari. I will accept information
concerning any Atari computer or video game system both new and old. I
plan to compile a listing (sort of a FAQ) and post it here for all to
see and will keep it up dated as long as I get new things to add to it.
Please email in the following (or any suitable) format:

For Magazines:
o Magazine Name
o Address (for subscription)
o Subscription rates
o Phone number
o type of Atari(s) covered (or type of programming covered,
i.e. M68k, C, Pascal,etc.)
For books:
o Title
o Author
o Publisher's Name (if available)
o ISBN
o Price (if available)

For Online-tutorials:
o Ftp address
o Directory
o Filename(s)

For telnet sites, gopher, www, etc:
o IP address
o Login:
o Pass:(if needed)
o Also instructions on how to find info,
subscribe etc. (if available)

Miscellaneous sources (Mailing Lists, Compuserve, Genie, etc.)
o Anything that isn't already covered
in AEO online for FAQs.
o For mailing lists
- Email Address & how to subscribe (if possible)

And anything else you feel is pertinent.
With ftp sites please send anything that is not covered in
the FAQ or clearly specified as having programming info.
Thankyou very much.
Email Submissions to: jonewby@unccsun.uncc.edu or jonewby@uncc.edu

That's true. I'll do something about it.

>Also, does the R:Time cartridge have its own crystal, or does it rely
>on the system clock? If the latter, it will have the same problem as
>TDLINE :(

The R:Time cart has its own crystal, but I believe the DOS only reads from
the cart on power up. From there, I think it uses its internal routine,
which is not PAL aware.

James,

Get a serial to parallel interface box. They're pretty much generic,
and you can get them about anywhere... like JDR Microdevices, or maybe
even your local computer shop. Plugs into the printer port, and produces
serial output.

3119. Serial printer on 8bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-15 04:55:58 UTC
From: kamaro_kid@delphi.com
Message-ID: <BS5Nnl+.kamaro_kid@delphi.com>
Source record: 100597

I just picked up a very nice looking AT&T serial printer - and would like to use it on my 8bit Atari.

Other than plugging it into my ATR and reconfiguring my R: port, are there any other options for using this type of printer on an 8bit?

-James King

3120. Re: 80 Columns on the 8bits...

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-15 08:51:43 UTC
From: ricortes@delphi.com
Message-ID: <J89u3F-.ricortes@delphi.com>
Source record: 100601

; The 8k block move is not needed at all. If you are smart, the only
;thing needed is: moveing the LSB/MSB pair of the display list up a
;line in the Display_List. If you are scrolling the entire screen then
;all thats involved is about 23 scroll operations, 1 320Byte zero
;routine, and 1 final move operation of the LSB/MSB pair. All in all,
;it doesnt take any massive amounts of time, and gives you added speed.
;This is the routine Itay Chamiel, and myself use for our 80 column
;screens.

OK, I'll byte, show us how smart you are & post the routine, I'm sure nobody would mind. I'm kind of interested to see how you resolve crossing 4k boundries in a graphics 8+16 screen.

;
; I suggest you take a look at Itay's or any other `smart` col80
;devices to see that no ASLing is needed for the actual character data.
;The trick used here is to have the Character format in a AA BB CC DD...
;format where both Right and Left character representations are done in
;a single normal 8 by 8 character font. All that is required is for you
;to AND $MASK to get the proper data, ie: for the right side use a Mask
;of #$0F and for the left side use #$F0. Quite fast indeed.

No big thing, with a centered character, it's only:

ASL
ASL
vs
AND #$F0

Wow! Your method only uses 2 skinny little bytes where mine uses two whole fat bytes! Heck if you're really worried about speed, just have two character sets in memory & then you don't have to do anything to them. Understand that what you are nit picking about here is programming style vs any real gain overall. I would describe my reaction to it as really underwhelmed. Since you are not using the fastest method, i.e. two character sets, then you shouldn't really talk speed or maybe just not use the term 'smart' so often. It suggests you may have a fear of shift operations, but in the interest of style, that's fine with me.

;If you did use the proportional text approach, I would _LOVE_ to see
;how you handle which BYTE of screen memory you are dealing with. Your
;method would easily lead you into a situation where you have to write
;to _2_ Bytes of memory instead of just one.

'OR' two bytes with memory, it's not really a problem, I did the routines for a shareware desktop publishing program a number of years ago. Are _YOU_ saying

you _THINK_ 2nd byte might be _TOO_ time consuming? If you saw the post Jeff McWilliams put up for the Action! mouse (thanks for the plug Jeff), it moves so fast that I originally put in timing loops to slow the thing down so it wouldn't flash across the screen. Jeff took them out for his purposes & the thing compares favorably to an ST or 386 as far as speed of the mouse goes. Got an Action! cart? I could knock it out in less then an hour. I could take your _COMMENTS_ as genuine if you like. It should take less time then responding to _THIS_ anyway.

;BTW: If you want to take a look at the character fonts of the following
; programs, just let me know. OMNI80, COL80 (8k scroll), COL80 (Itays),
;and even ICE-T.

Thanks, but no thanks, I've had Omniview installed in my computer for about 9 years now, I consider everything done since the original 800 version of Omniview, including my own, derivative work. I have 1/2 dozen incarnations of 80 column character sets, term programs, & 1 word processor. I can see why a lot people say 80 columns on an 8 bit sucks. I do understand that it's the only game in town for people who need it ergo the hot & cold reception these things get.

;BTW2: I am interested to see which character font you find most
; readable, as I'm going to be releasing/developing several utilities
; that will make use of my own 80col device.
I do like the crammed together 4 bit ones slightly better then 3 bit, but then I also like a 6 byte high character for 32 lines/screen. Go figure.

Rick

BTW: I'm still trying to accept the fact I seem to be in agreement with Glen Saunders about the real speed you & others say they are getting with 80 columns. I thought I would never see the day. If you put a stop watch or some other timing method on the thing while doing a text transfer of known size from a host, I think you will find you're getting much less then 14,400bits/sec*char/10bits.

3121. Re: FTE: wha-hoppen?

Source record: 100602

Hi all,

Just wanted to say that anybody who still hasn't recieved
3.2f will be recieving 3.2g. A few of you placed orders right before
3.2g was completed, but I just didn't have the heart to send out the
old version when 3.2g was so close to being finished.

As far as the 'File Exists' error when copying a file to
E: or S:, the temporary workaround is to copy the file from a
different drive. Such as,

D2:copy d1:readme.txt e: (notice that lowercase works!)

This is a pretty minor problem, and will be corrected on the
NEXT release. 3.2g should stir things up a bit, and there is no doubt
that some programs will not work on the new version. It will take some
time to find out what does or doesn't, but rest assured that your
feedback will be listened to.

Thanks to everyone for their support! It's been a really
busy few months, and I don't know if I will ever get caught up. <g>
We have added a 65816 processor to the MARS8 which is now working,
but there are a few problems with some PBI devices which still need
attention. On a brighter note, it works great with the MUX so I am
actually using it with a hard drive...

Mike

3122. 800XL schematics

Newsgroup: comp.sys.atari.8bit

Message-ID: <2tnk4r$s49@psuvax1.cse.psu.edu>
Source record: 100505

The 850 can only do 9600 (maybe Ill get around to making that faster)
the PR can do 19.2??? As can the MIO (supposedly...) and the Black Box.
The R-Verter does 19.2 as well...its just 2 chips and a few resistors.

Message-ID: <2tnllq$829@transfer.stratus.com>
Source record: 100507

I have an old Atari 400 system that I just dusted off. I forgot
how much fun those old games were. But know I seem to remember
why I packed it away, my joysticks are not responding correctly.

Can anyone help me locate replacements?
Does Atari still sell the repair parts (the white plastic inserts)?
What other types of joysticks can I use?
Also, where can I find a set of paddle controllers?
What are the going prices for these items?

Any help would be appreciated.

Well guess what!? You were asking about joystick controllers...

Ok, not only do Commodore 64's, 128's, Amiga's, Atari 2600's, 400/800/XL/XE's and ST's use joysticks (so SOME computer store SOMEwhere is BOUND to have at least ONE type of standard 'Atari'-style controller) .. BUT!

Sega's and Sega Genesis's use Atari-style controllers. (The difference with Sega controllers, however, is the [Start], and [A] and [C] buttons which are missing on old-fashioned controllers used with that list of computers/game-machines.)

Anyways.. if you want to use a Sega/Genesis controller on your Atari, all you have to know is that the directional-pad is for the stick movements, and that the >> [B] << fire-button on the controller corresponds to the standard Atari fire-button.

So far (hehe) no software on the Atari (that >I< know of) takes advantage of the other buttons available on Sega controllers.

Anyways.. I think I had too much sugar in my coffee! :)

In article <940614205332.2340deb6@sonoma.edu>, KENDRICK@sonoma.edu writes:
|> Ok.. JView is an EXCELLENT program. I got a few pre-made .RGB's which were
|> produced with JView and they look wonderful (except the version of CSView I
|> have doesn't do CV8).

Thanks for the kudos... I wish people would send in their registration to
give me positive feedback.

|> Now, I'm sure that .GIF's have got to be >THE< most common graphic type
|> nowadays, but you (Jeff Potter) have had experience with other graphics
|> formats, right? Like .IFF. Now, with some of the talk about modular programs
|> that's gone on around here (and in my Email), it came to me that you could
|> create a module which is pretty much everything JView does EXCEPT the .GIF
|> decoding. That is, process a screenful of Red/Green/Blue data into dithered

Yeah, that was one of my original plans. I have written other IFF and Degas
decoders, and could fit their front ends onto JVIEW. I started coding a
non-GIF JVIEW "skeleton" into which I could fit modular decoders. Maybe
even some modular output routines for yet more methods of display (wacko
monochrome flickering screens for more intensity resolution, or even dot
matrix printer?).

But it will probably sit idly on my floppy drive. Shareware registration
on JVIEW has been less than I expected. At least one of you out there
"promised" a registration when I came out with JVIEW, and has reneged.
Countless others seemed to wait breathlessly for its release, asking where
it could be located (while it was in beta test), then failed to register
after I released it.

Did I do something wrong? Was the implementation a lot less than people's
expectations? Or is this type of program now a thing of the past, an
outdated "widget" that only a few of you actually use? I'd appreciate
feedback, positive or negative. Otherwise, don't expect to see much in
the way of upgrades to it.

My special thanks to those of you who *have* registered JVIEW XL.

From: kamaro_kid@delphi.com
Message-ID: <p46Mv-7.kamaro_kid@delphi.com>
Source record: 100516

I have a three slave multiplexor system for sale or trade.

It comes complete with everything needed to fire up, including:

3 x MUX ROMS
original manuals/documentation
original software for use with SpartaDos 3.2d
3 x MUX Slave cartridges
1 x MUX MASTER cartridge
and approximately 40 foot of 34pin ribbon cable for interconnecting slaves.

Be the first on your block to have your own personal local area network
running on an 8bit Atari..

Original cost of this unit was:

2 slave MUX from CSS: $199.00
1 extra mux slave cart: $99.00
---
total initial cost about 1 year ago: $298.00

Will sell outright for around $200 or best offer - or will haggle on
interesting trades.

I have the following extra hardware for sale or trade (prefer trades:)

AT&T 476 wide-carriage serial printer with 3 new ribbons
Hayes 1200 Smartmodem w/power supply
AT&T 4024 1200baud modem (2224C compliant)
Slightly malfunctioning atari 850 Interface (R: handler has probs)
ATR8000 w/64k ram, 1x1.2meg, 1x1.44meg disk drive w/all cables & docs
Mac65 cart w/manual
Action cart w/manual
Adaptec 4000a scsi to MFM controller card
Atari CX85 number pad
Atari 410 tape recorder
2x XM301 300baud direct connection modems in original packaging w/docs
Monochrome monitor
Amdek Color-I color composite monitor
Goldstar 12" mono monitor
Magnavox mono monitor
2x plastic printer stands (supporting legs w/paper tray)
5x 180k and 360k half height floppy drives
180 FULL height floppy drive
3 slave CSS multiplexor network system (need around $200 cash)
30meg MFM FH hard drive (formatted out on an MIO)
20meg MFM HH hard drive (formatted out on an MIO)
40meg MFM HH hard drive (formatted out on an MIO)
70meg MFM FH hard drive (formatted out on an MIO)
2x Atari 1020 40 column printer/plotters w/pens & paper rolls
12 misc. joysticks
3x paddle sets
3x broken and slightly parted out 800xl's (cases still good shape w/KB)
1x broken and slightly parted out 130xe (case w/keyboard still good)

No, I am not getting rid of all my 8bit stuff. This is just a small sampling of stuff cluttering my closet. This doesnt even come close to putting a dent in the stuff building up and threatenting to topple over.

Make best offers on cash - or suggest some possible trades.

james,

Looking at one in a JDR Microdevices catalog right now.

Universal Serial/Parallel Converter.

Converts Centronics parallel to/from RS232 serial

64 byte buffer, 110 to 57,600 bps in serial mode

Hardware handshake RTS/CTS, software handshake XON/XOFF

Features DTE/DCE switch selectable mode

Power, status, parallel and serial busy LED indicators, 7-bit odd parity
or 8 bit no parity word lengths

Female DB25 and female CEN36 connectors

Includes AC adaptor and manual

costs 69.95.

I am looking to obtain an 830 and 815. Anybody got one?
also... and of the old 800 style Box kits... (i.e..entertainer..
programmer...etc...) just the boxes I want... do the new XL versions
have this type of structure or are they just glued cardboard?

anybody got an MIO ?!!? I have 2: 256k and a 1meg. The 1 meg
works fine except there is no ram on it...(thus it doesnt work
anymore...) and the 256k version flakes out completely and has good ram!
any offers? these 2 pieces of paper weights for a working mio or BB?

tanks.

Andrew

My emulator development has got to a stage where I now need to use a ROM image. I was going to use the AT800XL images, but I checked and they are revision B ROM's. I want the Rev C. I haven't got a dbl density drive for my atari, and haven't yet got to building a SIO2PC lead, so could someone provide me with a ROM image, please. Just straight binary of the complete ROM, pref. in a single file.

Thanks in advance, Zargwog...

PS. it will still be a long time before the emulator is even at Beta level, so don't get too excited just yet....:)

JG> MYDOS disk...
JG>
JG> What am I doing wrong ???
JG> Please help me as all I need the XE for is communications and,
JG> thusly, is it now useless. Thanks.

I believe that your problem lies in the fact that you are using the
1050 floppy drive, which -- unless it has been upgraded to true Double
Density with a US Doubler upgrade -- at best can only manage single to
"enhanced" density disk sectors. The UTIL utility (it is my understanding)
is only designed to work in *-DOUBLE-* density format that a US Doubled 1050
or an ATARI XF551 is capable of.

Take heart, however, as there is a transfer program called "MULE" (I
call it "mule train" so not to confuse it with the ATARI game MULE. Hmm...
perhaps "MULE 1050" or "1050 MULE" might be a better name.) that can
transfer -- one program per floppy -- a program from an IBM floppy drive to
an ATARI 1050 standard drive. From what I understand, the program is
awkward to use, as it can only transfer a single disk file at a time, one
file per floppy, but as you only have two programs that you need to
transfer, "1050 MULE train" would be a more than adequate solution. (The
SIO2PC special cable is a more permanent solution, allowing you to actually
--REPLACE-- the ATARI 1050 with the entire IBM working as a slaved drive
server.)

P.S. After you "jump start" your system with a DOS and a communications
program, a simple "null modem" cable will do the trick for transferring
files across. An SIO2PC cable is not a lot more expensive than a null
modem cable (only somewhat more expensive). Good luck!

GS> Does "more" let you go backwards?

Yes, it does.... The current version of UNIX "more", is known as
"less" --PRECISELY!-- because it allows the user to scroll in the other
direction, a.k.a. "backwards", as well as a thousand other things....

GS> What about ATASCII?

What about it? Try reading the UNIX manual page for the STTY "KEYMAP"
feature. ATASCII is no problem (neither is PETSCII for that matter); UNIX
can map anything into anything else --INCLUDING-- ATASCII End-Of-Line.
UNIX is designed for --REAL-- computer environments.

GS> Come on...

Yes, come on and read the system documentation for a change, before
you charge in making blanket statements and generalizations! UNIX is
--NOT-- like the other operating systems that you have been used to in the
past... thankfully! <* big grin! *>

Message-ID: <CrHnLK.1xK@merk.com>
Source record: 100534

Speaking of SPARTADOS... what is it that makes SPARTADOS so special in the first place? I'm curious.... From what I understand, you can set the time and the date to "time stamp" your files. SPARTADOS also supports sub-directories. SPARTADOS has a nice forty-column directory display. SPARTADOS has a "batch language". From what I understand, the release of SPARTADOS is for a single density disk drive. On a single density floppy disk of 707 sectors I can fit maybe three good programs of 220 sectors each. What would I use a batch language for? What would I use subdirectories for when I have only three filenames I need to remember? I am actually, genuinely curious... not participating in a SPARTADOS flame-war. The reason that I ask these questions is that ATARI DOS XE, when it was released with the ATARI XF551, offers virtually these same features. After booting DOS XE up once, it is now proudly collecting dust at the back of my floppy disk collection, and I finally went from using the original DOS 2.5 that came with the XF551, to MYDOS. I would like to send away and register SPARTADOS in order to support ATARI software providers, but I still have this nagging memory of having sent away to ATARI corporate itself to register DOS XE (with a more than underwhelming result). Can someone give me a useful justification for sending away for the SPARTADOS instruction manuals apart from the fact that a handful of ATARI software authors with hard drives refuse to write for any other DOS. I really --WOULD-- like to send away for it, but I have been traumatized by the "number" that ATARI corporate did on me. I think I might need some gentle encouragement. Thank you.

3153. Re: Serial printer on 8bit Atari

Newsgroup: comp.sys.atari.8bit

Source record: 100535

Peter Hinssen asked me to post this for him because he doesn't get it on
the news himself...

Subject: Atari 6502 Cross Assembler for the mac.

Hi,

I'm working on an Atari 6502 Assembler on the mac.

The assembler is pretty much finished, but what I want is to download
the
files on the Atari. The Mac side of the RS232 connection is finished,
and
the cable with the MAX232 chips is a peace of cake. But ...

I DON'T KNOW HOW TO DO THE RECEPTION OF THE RS232 ON THE ATARI.

What I'm looking for is code that does simple polling on the Atari side
of
the RS232 and stores that information into memory.

I know it's just a matter of changing the interrupt vectors and a
little
code, but I can't figure it out.

Anyone who can help? Please?

Thanks,
Peter Hinssen.

SpartaDos is a Command Processor type DOS, not a menu type, like
all the Atari DOSes. It was patterned (I believe) after MS-DOS,
and users of both systems can readily see this. It is far
more powerful and useful for the "power user" ... but perhaps
its power and advantages would be of little or no use to the
novice user or someone who has no interest in learning
(memorizing) the essential command line "commands".

For all those of you who don't understand spanish I'll kindly translate
(mainly 'cos I've got nothing better to do :( )
Hi all, I would like to know where I can find more information on assemblers
(assembly?) for atari, I would also like info on ANTIC and the 6502.
I would also like to know how to handle the peripheral output ports such as
the disk port (serial port?) in order to build a robot arm.

PLEASE DON'T answer to me, ok? I only translated this... answers to
fvaldes@dcc.uchile.cl

>

If this was the orginal ARC.EXE for the PC, I don't wonder. It was
extremely slow (all compiled C code, and on that generation of
non-optimizing comilers.) Phil Katz then wrote a assembly language
program (split into paiors ..PKARC and PKXARC) that blew it away almost
completely, til the ARC people took him to court for using a compatible
format, and the three letters ARC. Thus, he changed his program first to
PKPAK and PKUNPAK with the same format, but different file extensions,
then to the better format we are all familiar with, PKZIP and PKUNZIP, and
the ZIP format. The latest version of PKARC and PKXARC that I am aware of
is 3.5, which by court agreement had to be withdrawn from the market (but
you may still find them around on BBSs or someplace .. especially if you
know a long time download collector) It literally was about 5 or 6 times
faster than ARC, on the same hardware.

3159. Ice-T v1.0 - need help!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-16 19:33:17 UTC
From: BRUCKA@eruvin.jct.ac.il
Message-ID: <940616223031.4217@eruvin.jct.ac.il>
Source record: 100539

(This is from me, Itay Chamiel. Please do not reply to this message via Email, since I don't normally use this Vax account. Please Email to bruck@brachot.jct.ac.il if you wish to reply.)

Ice-T version one, with the additions of screen-saver (one page of history), fine-scrolling, and a more serious buffer, designed to withstand high baud-rates.

BUT.. I need help.
First: How to I set the interface to use 14.4 or 19.2 baud? Is this the same command to set for the lower baud rates? If so, what parameters do I need?

Also:
The fine-scroller, despite not having any bugs :) :) :) causes trouble, because it's in a VBI, and it's time-hungry. It doesn't seem to have enough time in deferred-mode, to complete a phase (there are 8 phases, one each frame following an EOL) before the screen actually gets drawn on the screen. This especially mucks up upwards scrolling. Down still looks ok. Another method I tried was using immediate mode. That caused alot more junk all over the screen. So I have a timing problem. Can anyone help?

I NEED answers before I can release this (and actually demand a Shareware fee)!! :)

-itay chamiel

Winston,

Well, first off, many programs aren't 220 sectors in length, so you can actualy put more of than 3 of them on a 90K disk. But spartados also supports 180K, 360K, 720K floppies, as well as hard drives, partitioned into 16 megabyte partitions. This increases the usefulness of SpartaDOS significantly.

Further, as pooses tothe menu like interface of AtariDOS, and DOS XE, etc. Sparta-DOS is a command line interpreter, like MS-DOS and Unix. Of course, there are those who dread the command line, and so use a menu program with SpartaDOS to make it work like AtariDOS.

I hope this helps.

Jeff

Geeze, I just threw away my "Entertainer" box last week (was residing in my attic for over 10 years).

Unix is a 7-byte ASCII system. Since when can it support the full 128+128 inverse Atascii character set? It would probably strip it out.

Pico in ATASCII? I doubt it.

I've noticed that in the newsgroups you can slip IBMASCII grahics under the qwk packets so you can see that sometimes but that isn't high-bit characters.

I understand the mapping features but there is a limit to how far you can go with it.

If you have shell scripts or other little bits of configuring which allow you to, let's say, view a text file in ATASCII, then I'm sure more than one person here would like to see it.

I've already customized my shell with aliases and changed the prompt and added paths to make it comfortable for me, but doing ATASCII sounds like more trouble than it is worth.

Actually, you're way off line when you say SpartaDos is made for
single density disk drives - when in fact, I have SpartaDos managing
800meg of hard drive storage at 16meg partitions each.

SpartaDos has MANY features superior to any other dos out there - and doesnt
require some brainless MENU interface to maneuver through it with.
(personal opinion there)

With SpartaDos, you can have multiple (read THOUSANDS) of subdirectories
with subdirs under each of those, time date stamping, path locations,
file searches throughout all known drives (including hard drive
partitions), high speed file transfer, a library of thousands of
files supporting it specifically and much much more.

Hope this helps you understand the fascination with this OS on the
8bit Atari.. SpartaDos is for the 8bit what OS/2 and DOS 5-6.x are
for the IBM PC compat.

3166. Ultima IV editor

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-17 00:36:06 UTC
From: lee912@cs.uidaho.edu
Message-ID: <2tqr5m$d13@owl.csrv.uidaho.edu>
Source record: 100546

Two years ago I wrote an editor for Ultima IV, just for fun during my summer vacation. It's a fairly good program, IMO, written in assembly language. It allows the user to modify the following:

o The Brittannia map. This does not include the positions of moongates, townes, dungeons, or other items :(I never got around to figuring those out-- If one of you knows how this is set up, please tell me how, as I have no time for research.
o Towne maps. The people can be moved and modified.
o Screens. The party and monster starting positions can be modified.
o Dungeons.
o Dungeon Rooms. The party entry-point poistions for each of the cardinal directions can be changed. The monster positions and types can be changed. Triggers can be relocated and the replacement types and positions can be changed.

It has a number of "oh, gosh" features with limited or no usefulness:

o Peer at gem capability for both dungeons and maps.
o The graphics are animated like Ultima IV-- the fire flickers, the flags wave, etc., but people and monsters do not change.
o You can turn on line-of-sight blocking of view, just like ultima IV does

Oh, it requires 48K, but it does NOT require an XL/XE. :)

You are probably thinking "Why aren't you just uploading it". The reason is that the program has a few problems which are the result of my thinking that it would never be used by other people. The reason I thought this was that the Atari world was dead as far as I could tell at the time. I didn't know anybody else who owned an Atari 8bit, and I didn't know about the internet.

So the program assumes SpartaDos--all file-based I/O assumes relative offset positioning. The program also assumes there exists a drive named D9: which contains both the entire 64K Brittannia Map, as a SpartaDOS file, and an 8K Ultima icon file. It also has only two drawing options: point plot and block-fill. Block fill is not as neat as it sounds, it fills a standard ultima square: 32 x 32 cells (if I remember correctly).

I can and would fix these problems, and in fact have been meaning to for over a year, but I just don't seem to ever get around to it.

If there is any interest, I will upload the source code in both MAC65 asssembly language and Action! form. If there is no interest, I won't bother with the hassle(no modem, so I'll have to use a PC, ick...).

:
: Just thought I'd clarify based on personal experience.

No problem, just one addition -=> you may have had an odd P:R: connection...
I've heard others in this group claiming it won't fully support 19.2k, but I've
used it for such. Maybe since it was a bit close to a few lightning strikes,
it's a bit over-anxious, I really don't know... but it seems to work fine at
19.2k for me (and was claimed to safely navigate up to this speed in the old
ICD ads too)!

-Tim

PS: What is it with flow control and the MIO??? I can't figure this one out...
I used to use an old RVERTER-type connector with my modem running Omnicom/term
(80 columns - simulated) at 2400 quite effectively. When I try this through
the MIO, I get generous amounts of character loss!!! Yep, at 2400 baud only!
It's not bad until after the first thousand bytes of email or such. The ONLY
variation has been the MIO vs. RVERTER exchange.

In article <2tqoqb$s6v@sundog.tiac.net> krishna@max.tiac.net (Glenn M. Saunders) writes:

Unix is a 7-byte ASCII system. Since when can it support the full 128+128
inverse Atascii character set? It would probably strip it out.

I don't think so. Why do I have a Perl script which conveniently
converts {|}[\] to conventional ISO 8859-1 (8-bit) Scandinavian
characters? Just because most US Unix systems base their E-mail on 7
bits, doesn't mean the rest of the world does. There is *nothing*
inherent in Unix itself that limits characters to 7 bits.

Incidentally, NNTP (ie Usenet news) supports 8-bit characters (use
ISO 8859 or get flamed severely ;).

Pico in ATASCII? I doubt it.

Woss Pico?

[...]

I understand the mapping features but there is a limit to how far you can
go with it.

You can certainly go far enough. The same perl script I mentioned
above also converts from ATASCII return (155, which is >127) into the
conventional \n.

If you have shell scripts or other little bits of configuring which allow
you to, let's say, view a text file in ATASCII, then I'm sure more than
one person here would like to see it.

For that, of course, you would need a new font. This has to do with
the shape of the characters, and has nothing to do with the number of
bits per character.

By the way, making such a text file viewer would probably not be too
much of a problem in X.

I've already customized my shell with aliases and changed the prompt and
added paths to make it comfortable for me, but doing ATASCII sounds like
more trouble than it is worth.

Depends what you want to do. It's simple to convert ATASCII symbols
to similar ASCII (or ISO 8859 for that matter) symbols; the diagonal
lines into slashes, horizontal line into dash, etc.

Ok, I'll bite, what the heck is JVIEW? Some type of graphics viewer I gather thus far... but does it allow:
- 1) editing/by pixel or color
- 2) greyscale/shade/color adjustments (fine tuning)
- 3) output to a more standard Atari format (16 color GTIA, 4 color 160x192, 16 color 160x76, etc.)
- 4) printer dumps
- 5) loading a "standard" Atari image of some generic format with an option to save to .gif (for exporting to the general multiplatform internet community)

.. if not, no biggie, just curious what all it is/can do! Feel like posting the "doc" file or an intro on it here? I bet you'll get a few more takers!

Mr. Fixit was asking what JView XL is...

WELL! It just happens to be one of the coolest graphics viewing programs on the 8bit! :)

It (as it sits) loads .GIF graphics files. It can view them in the following modes:

Graphics 9 80 x 192 x 16 grey
ColorView 9 80 x 192 x 4096 RGB colors
Graphics 15 160 x 192 x 4 grey
ColorView 15 160 x 192 x 64 RGB colors
Graphics 8 320 x 192 x black/white
ColorView 8 320 x 192 x 8 RGB colors (best with Chroma/Luma outputs used)

It had five dithering modes:

No dithering (I'm assuming Gr9,CV9 & CV15 outputs are IDENTICAL to APACView?)
4 x 4 dithering
2 x 4 dithering
2 x 2 dithering
Random dithering

It saves in the following file formats:

Graphics 9 (raw, uncompressed)
Graphics 15 (raw, uncompressed - ie, MicroPainter (I think?))
Graphics 8 (raw, uncompressed)
ColorView (three files: file.R, file.G, file.B - loadable with ColrView)
ColorViewSquashed (one ColorView Squashed (one filth CSView)

Other programs that play with this sort of stuff include:

AT8GIF - an old Atari GIF viewer that loaded into Graphics 15 or Graphics 8 (it attempted color by using Black/Red/Green/Blue)
APACView - predecessor to JView. It also loaded into APAC mode (80 x 96 x 256 Atari Colors) and Graphics 11 (80 x 96 x 16 Hues). It did not SHOW ColorView images, didn't do ColorView 8 mode, and couldn't save ColorViewSquashed files. It didn't load ColorView screens all at once, but rather in three steps. It did however load Pryzm/APAC-Interlaced screens (which are identical in format, but are viewed differently) and also loaded normal APAC screens.
GIFNCode - this creates GIF files out of Atari Graphics 8, 9 and 15 modes. It supports most of the Atari compressed graphic file formats (like Koala). It (like stated) didn't handle ColorView modes. (Damn!)
ColrView - this loads ColorView screens (only CV9 and CV15, not CV8 (yet?)). It loads all three .R/.G/.B files and views them.

ColorViewSquash - this loads ColorView screens (.R/.G./B files) (I have not personally seen a version which loads CV8's, but seeing as JView is the first program to MAKE CV8's, and can compress files like ColorViewSquash does, I guess it doesn't matter). It let's you add a one-line title, and saves the file as one ColorViewSquashed image (file.RGB). It does not view ColorView screens in true ColorView modes. It also can't LOAD ColorViewSquashed files.
ColorSquashView - this loads the ColorViewSquashed files created with ColorViewSquash (and now with JView). It lets you set up a slide-show with automatic or manual advancing of images. It lets you chose either all or some of the files in any one directory on any drive (including D9:). The newer version handles CV8 screens.

Anyways.. there's a rundown of all of those cool graphics programs!

Before, to view GIF's in ColorView mode, you'd need to load a GIF three times with APACView, saving each file as file.R, file.G, and file.B, and the load those files with ColrView.

Then, with the introduction of ColorViewSquash, you were able to compress the three .R/.G/.B files into the on .RGB file, thus saving space. To load these, you'd load ColorSquashView (CSView).

NOW, with JView XL around, all you need to do is load the GIF once and save it as a ColorViewSquashed file (file.RGB) OR, if you prefer, as a set of ColorView .R/.G/.B files. If you do it the first way, you'd use ColorSquashView (CSView) to load and view the image. If you did it the second way, you'd use ColrView (UNLESS the image is a CV8 picture).

All of this loading / compressing / loading stuff has to do with ColorView screens, though! If you want to load/save/view files in Graphics 8, 9 or 15 modes, you'd use other (most of which have been around for MANY years) programs to compress, load and view. (Or you could just write this in TurboBASIC XL <grin> 10 GRAPHICS 9:OPEN #1,4,0,"file.GR9":BGET #1,DPEEK(88),7680:GET N <g>)

Whew.. I bet by now Jeff's already answered this question in a few words! Oh well! Read his or mine, it doesn't matter! I JUST WASTED MY TIME TYPING THIS! (hehe, it's a joke, folks)

(And if who-ever-it-is-sorry-I've-forgotten-who-you-are wants to add this thing to the F.A.Q., go ahead! :^))

As far as I can tell, when TYPING unix always strips the 8th bit.

Now it may be able to SEND 8 bits but I don't think it will allow you to,
say, customize the set so you can use vi or emacs or pico (it is an
editor) so you can make Atascii cartoons.

Someone show me I'm wrong :)

Of course, if you tried to work with unix in ATASCII you'd switch to Bobterm.

As for the mapping, it is really convenient that we use an EOL and not a
CR/LF because of unix using only the newline (LF) for a return.

Oh, and another thing. One of the reasons it is hard to generate
graphics characters is because a lot of utilities, like pico, have
control key commands. Some also use the escape key.

As far as I can tell, when TYPING unix always strips the 8th bit.

That depends on your setup. Most of our Unixen allow 8 bits through (us being in Norway 'n all, it's useful to get all those weird characters in ;). It's platform-specific, I think. But in Emacs it's no problem at all.

Now it may be able to SEND 8 bits but I don't think it will allow you to, say, customize the set so you can use vi or emacs or pico (it is an editor) so you can make Atascii cartoons.

Don't see why not. You could simply remap C-M-[whatever] to the equivalent Atari control character in Emacs (or use C-q [octal code], if you're lazy), and even if it doesn't display it properly, it will save it just fine. Then you could hack your own version of xless which displayed it, too.

Someone show me I'm wrong :)

No can do. I'm far too lazy for that ;)

Of course, if you tried to work with unix in ATASCII you'd switch to Bobterm.

Umm... I would? Hang on, are you trying to use Bobterm to connect to a Unix host, and then display ATASCII on your Atari? If so, it's dead easy, just make a termcap entry for it. Hmm... You might need to define a POSIX locale as well (depending on what applications you want to run). OK, not so simple, but certainly possible :)

I *think* you can define which characters are printable and which aren't in Emacs, so if you're actually using an Atari as your terminal, you might be able to do it that way.

As for the mapping, it is really convenient that we use an EOL and not a CR/LF because of unix using only the newline (LF) for a return.

Ya, but that's pretty simple too. My Perl script (getting tired of it yet? ;) converts a crlf to an lf, and a standalone cr to an lf (for Mac compatibility). It's a questin of termcaps again, if you want to use Bobterm

Oh, and another thing. One of the reasons it is hard to generate graphics characters is because a lot of utilities, like pico, have

control key commands. Some also use the escape key.

Sure, but you can always use C-v or C-q to generate a chatacter by its
octal code.

If anyone is interested in a simple little Action! bulletin board I wrote, I'd be willing to spend the time to write up some documents and ARC the thing up.

It has a pretty good editor, supports mainly IBM/80 columns (ie, not ATASCII in the editors, except for editor controls like delete line and stuff) and I got around the 40/80 mess by writing text files in a unique way so it looks fine in 80 columns and doesn't have messed up line-wrapping in 40 columns.

It supports a bulletin file, door programs (the ones I've made are written and compiled in Action!, like the BBS). It's not a very smart BBS - it can't figure out what time it is or day it is (hadn't bothered with that yet), it can't tell if the user mysteriously logged off, and it's probably not fool proof in a hundred other ways.

It does NOT have file transfer or a very large editor (I was planning on making a door program which was pretty much an editor and used all of the free memory as the text buffer).

It supports up to 10 message bases. The current voting area supports up to 10 voting questions, each with 10 answers (it may be 9 in both cases.. actually, I think it is). The voting area was (due to lack of RAM) converted into a door. The other doors are a users'-quotes door, a simple hidden-maze game, a system-statistics (which is a little buggy) door, and I started work on a multi-user 'Stellar War/Conquest' style game, but it never got completed.

It is pretty user friendly, even the "More?" prompt can give you help information.

It was only tested with an R:Verter and an SX212, and I'm not quite sure HOW fast the damned thing can go!

If I do release it, I'll release the source code, of course. Again, it's in Action! (but I will compile it with the runtime routines, if they fit! :) - I used to compile it without them and whenever I'd run the BBS, I'd keep the Action! cartridge plugged in).

Anyways, the program is MyBBS version 0.0. I may soon start work on MyBBS 1.0 which will be 'friendly' with some of the other utility style programs I'll be working on (maybe).

So! Anyone with interest, please post about it or e-mail me. I'll be FTP'ing it to umich's archives (so nonFTP'ers will have to BART it) if I do release it.

I still need help with the timing.. How can I use as much VBI time as possible without causing junk in the display? (since I have to change the display list.)

Defferred mode causes junk, and immediate mode ALSO causes junk.. so what do I do??

In a message dated 6-15-94, Mike at FTE said:

"We have added a 65816 processor to the MARS8 which is now
working,"

Have you had any thoughts about providing for adding RAM above the normal banked RAM space (i.e., not seen or refreshed by the ANTIC, thus removing timing restraints), and adding a circuit to kick up the clock speed when those addresses are used?

I realise this would mean either adding a separate refresh circuit for this RAM, or using static RAM, but depending on the speed rating of the 65816 used, it could be well worth it.

Of course, this brings up the question, "How much can you stuff in an 800XL and still close the lid"? <GRIN>

In a message dated 6-15-94, James King said:

"Perhaps both CD and CWD and RD and DELDIR can coexist in
one release of Sparta?"

Of course, this would increase the size of SpartaDOS a bit. Unless, of course, he made it so that command alternatives could be configured, and then a new version written to disk. Hmmm...that should open the possibility to aliasing any of the commands.

Of course, an "ALIAS" command (such as found in AmigaDOS) would be nice, but you have that code bloat problem again. Perhaps this could be added to an "H" (for harddisk or RAMdisk) version of SpartaDOS.

Of course, that wouldn't help me much unless he also added a similiar capability to a upgrade to SDX. <grin>

Well there are more poeple that has a 14k4 modem connect to there ATARI
XL/XE.... I use also a 14k4 modem on my 800XL with a BlackBox and a
140MB HD and I run a PRO bbs with it....
And there are more PRO BBSses that are running 14k4 baud.

You can use BOBTERM 1.21 for the 14.400 baud rate...
I use it with the BB and it works great....
Switch ON the RTS/CTS in your modem and your BB and NO problems.

> PS: will Flickerterm support 14.4k?

I hope so....

Well I see phbill has already answered most of these, but:

In article <CrIpzE.DC6@utnetw.utoledo.edu>, timuszyn@jupiter.cse.utoledo.edu (Mr. Fixit) writes:
|>
|> Ok, I'll bite, what the heck is JVIEW? Some type of graphics viewer I gather
|> thus far... but does it allow:
|> - 1) editing/by pixel or color

sorry, no editing

|> - 2) greyscale/shade/color adjustments (fine tuning)

of a sorts - you can adjust the color (hue) interactively. You can select
the mode of dithering before you decode the pic.

|> - 3) output to a more standard Atari format (16 color GTIA, 4 color 160x192,
|> 16 color 160x76, etc.)

Yes, 16 level GR.9, 4 level GR.15, or 2 level GR.8 in B&W, as well as the
colorview modes phbill talked about.

|> - 4) printer dumps

No, not unless you use another program to take the above output and
print it. I was going to address this in a "future upgrade", but I'll
see how enthusiasm runs amongst the users.

|> - 5) loading a "standard" Atari image of some generic format with an option
|> to save to .gif (for exporting to the general multiplatform internet
|> community)

not by JVIEW, but by my other program GIFNCODE (which BTW, I have a version
to force the horz. res. to 320, so plain vanilla PC GIF viewers can see our
pics in the right aspect ratio; any interest here?).

Jeff, you were saying you fixed up GIFNCode to write out 320 x 200 GIFs so that stupid IBM GIF-readers and stupid IBM users of GIF-readers won't say stupid things like "Wow! You're thin! Haha! I'm funny! haha!".. well.. >I'M< INTERESTED! :)

So far what I've done in the world of ColrView is something which you (if you ever decided to make another version of GIFNCode) could do for CV9 screens - dither a palette of 48 colors (16 reds, 16 greens, 16 blues) together in place of the 4096 RGB colors of ColrView.

Hmm.. now I'm wondering how difficult it'd be to make a CV9 viewer like that on the Atari (using a small palette and dithering the pixels around rather than using a true ColorView mode).. Anyways, I digress (as usual) :)

I guess what I'm asking is .. will there ever be a version of GIFNCode that does ColorView modes? CV15 and CV8 should be easy peasy. CV9 you could get around the way I did in RGB/GR9 Viewer (I could send that to you - do you actually have an IBM machine, Jeff?). The unfortunate thing about RGB/GR9 (especially now that JView saves as .RGB's automatically) is that it doesn't actually LOAD .RGB images, only uncompressed files. It also doesn't do (yet) the Atari OS color palette (I know you sent me info. on how - I just never got around to it. I've been doing nil programming on this stupid IBM :)).

To others, however, there's a pretty easy way to get around people laughing at your Gr9 images when you GIFNCode them.. just make a new file (using TurboBASIC or BASIC or something) which only has every fourth line of the original in it - that's one of the ways RGB/GR9 Viewer loads GR9 files. Hell, you could even make a 'collage' of four GR9 images to fill up the 80 x 192 space!

Anyways, enough babble.. so Jeff? Any more work gonna be done on GIFNCode? Or am I gonna have to get a bitmapped-graphics book again and start working on my OWN!? :)

(BTW- registration for JView XL from me will be sent to you as soon as I boot up my XL again so I can read the DOCs.. man, I hate IBMs!)

MSDOS handled both erase and delete, which is why that wasn't changed.

I looked into supporting multiple names for each command, to leave the
older ones available, but part of the internal structure made this
difficult.

SpartaDOS works on any size floppy, and hard drives up to 16 megs. You won't find a problem figuring out how to put subdirectories to good use.

Lower memlo than MYDOS, and yet access to DOS is instant with no DUP.SYS and MEM.SAV disk I/O stuff.

I find the batch processing extremely useful in programming, where repetitive actions such as assembling or backing up files can be automated. It's useful to load different setups on bootup as well. Basically, it automates any repetitive action you want.

John Harris - jharris@cup.portal.com

3190. 80 Columns on the 8-Bit

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-18 07:38:11 UTC
From: b.poehland@genie.geis.com
Message-ID: <199406180737.AA014055069@relay2.geis.com>
Source record: 100469

In the XEP80, ROM CO34703 (at the front of the board, beside the 8K SRAM), contains the code for the character set, firmware REV 0.5. The ROM at the rear of the board (CO34702) contains interface firmware REV 41.1. I'm not exactly sure what's in there, probably handler code for the parallel port & programming interface code & whatever...

Both of these chips are 2364-type 8K ROMs. Now, dadburnit, despite my best efforts I've not been able to either find a source for blank 2364's or a pinout of the 2364 in a chip databook. If indeed the pinout of the 2364 is identical to that of a 2764 EPROM, then it would be possible to download the ROM code to disk using a burner. Once it's on disk, the programmer-types would fire up a sector editor & start having some fun.

BUT... if the pinout of a 2364 is NOT the same as a 2764, then you run the risk of frying the chip. Not only do you not get to see the code, but your XEP80 becomes a doorstop. Any volunteers? :)

Of course, if Tramiel & Co. would release the schematics for the XEP80, all these questions would be answered in a glance. What rotten bums those guys are. I've bugged Brad Koda for these docs about a million times, he always says he can't get it.

I know for a fact the handler firmware for the printer port contains a bug. It's the same stupid bug Atari burned into early versions of the 850 ROM: the printer port handshaking times out too soon. If you dump a big text file to a slow printer, the printer keeps sending a BUSY signal to the XEP80 until the printer's internal buffer empties & asks for more data from the XEP80. But if the printer keeps the XEP80 waiting too long, the XEP80 gives up & poops out with a TIMEOUT error. I don't know the timeout exactly, but I think it's only around 10 seconds. It should be at least 30. Using an Epson L-1000 parallel printer with an 8K internal buffer, if I dump a 10-page document to the Epson thru the XEP80 parallel port, I get maybe 3 or 4 pages out before the XEP80 quits. Really annoying. The only cure is to stick a print buffer between the XEP80 & the printer.

At the 1990 WAACE Fest I confronted Bob Brodie about this. He of course pretended he didn't have the faintest idea what I was talking about. I dutifully reported the conversation in Current Notes but got zero response from readers.

On another note regarding the XEP80, Atari used two different versions of the 48-pin LSI CRT controller chip: the NS455 & the NS405. Three gold stars & a dog bone to *ANYBODY* who can tell this newsgroup where to buy this chip! I can't find it ANYWHERE!

There may be a reason why these chips aren't available: Atari may have bought them as salvage parts (!). The NS405/455 contains onboard ROM, but Atari elected not to use it, instead installing a separate ROM. Bob Woolley told me he managed to peek at the ROM on the NS405 & discovered to his surprise it contained code! Junk code, gibberish. If Atari bought the chips new the on-board ROM would be blank. So *somebody* had already programmed these chips, which meant Atari couldn't use the onboard ROM to store its firmware & had to resort to the more wasteful arrangement of using an outboard ROM. But it also means the chips were basically trash, therefore available at a price guaranteed to draw anyone named "Tramiel" out of the woodwork.

For a final kicker, the firmware ROM at the rear of the board contains less than 4K of code, but Atari used an 8K ROM for it. So the ROM is mostly empty space. Go figure.

Hrrumph!! Nice to know the XEP80 was such a sleek, well implemented design!
No wonder people are dying to best it. If people are gonna start
pushing terminal programs to the theoretical data handling limit of the 6502,
err... considering the Mars8 now has a 65816, the theoretical data handling
limit of THAT, I'd still be happy to see just a plain vanilla 6845
with pokable screen memory plugged into the PBI. It outputs TTL, so slap
the AC TTL upgrade into the computer, and move from a C.Video switchbox
to a TTL switchbox! You could burn as many character sets into a ROM as
you wanted too.

There I go again... ranting and raving about vaporware!!! Sorry, Ben.

Reading from a well worn, and fairly old, Unix manual (from before our
breakup .. Unix System 5.0 release 1982), the stty command, which
configure parity and such for Unix:

begin quote

Control Modes ......
parenb (-parenb) enable (disable) parity generation and detection
....
cs5 cs6 cs7 cs8 select character size
....
....
Input modes
....
istrip (-istrip) strip (do not strip) input characters to 7 bits
....

end quote

>Pico in ATASCII? I doubt it.
>
>I've noticed that in the newsgroups you can slip IBMASCII grahics under
>the qwk packets so you can see that sometimes but that isn't high-bit
>characters.

>
>

The Unix tr command would handle the EOL translations for ATASCII files
just fine, but to do full proper EOL translation would probably require
setting the port to raw mode, and writing a two way trnaslation program to
front end the shell. Not tough at all, but I don't know of anyone who has
done it.

Nope .. just use stty -parenb to turn off parity bit generation. The fact
that most files will then show SPACE parity is purely a function of most
of them being seven bit text to start with.

You should be able to convert the 6545 to a composite out as well as ttl.
You could then just blank the existing screen & enable the '45. It wouldn't
be as nice as a good ttl monitor, but at least you could use the same monitor.
I'd guess the glue chips to do it would be < $5.

I also have been using an 14.4 modem on a Pro! board until today. The
Atare Scene has run with a Hayes Optima 14.4 for a year or two. As of
this morning, I switched the system over to Transcendence on a Mega ST.

Using the MIO, I simply set the port to 19.2 and the modem buffers
everything just fine. The problem was that the software was slower at
spitting out characters than the modem! The switch to the ST has
remedied that.

3200. I'm working on a game, and...

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-19 01:39:36 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940618183946.23418d74@sonoma.edu>
Source record: 100478

Hi.. I'm working (ever so slowly!) on a new game, and this time I really'd like at least some music in the title.. now, what good PD (or other) sound editors are there around for A8's? I've heard BenjySoundMonitor stuff in a lot of demos, and those are usually REALLY good (then again, they're usually by Stephen Dusterhof (sp?) I believe, and I'm getting to become a big fan of him :)

Anyways.. the game is being written in Action! (YES!, I'm not doing TurboBASIC XL, surprise surprise :)) and will be comprised of a few different programs - title, intro, game, ending(perhaps?).. the music will probably be only during the intro and ending because I don't want to plug up the CPU with more-or-less useless stuff, and also I'm gonna be needing all the free sound channels I can get :)

So..... would anyone be interested in DOING any music for me? (you will of course be in the credits) or can anyone recommend a good/easy-to-use/fairly--new music editor?

thanx
-bill

3201. .gz extension

Newsgroup: comp.sys.atari.8bit

Just curious -- I've just dl'ed multiple files from src.doc.ic.ac.uk - and most have a file extension of .gz Per the logon instructions at that site, I'm to read the files README and README.ftp - but Delphi wont allow capitalized file names, so I'm unable to read those documents.

What do I have to do with Atari files with the added extension of .gz?

I sold my XEP80 & tech docs last year, but as I recall from that
documentation, the XEP80 has BOTH ATASCII and ATASCII character sets
built in, selectable with software.
I never saw the ASCII set, but the ATASCII set was shown off in a demo
included on the XEP80 driver disk.

At one time I toyed with the idea of writing a terminal program that
used the ASCII set, but I didn't want to deal with all the serial
communication headaches.

>
>YES!

Where would you put this alias table? I know they're great (I use
them on a Unix system to translate MSDOS commands, and on an MSDOS
system w/ 4DOS to translate Unix commands) but on a 64k-256k machine,
your table length would be very limited, at least compared to the ones
I use.
I like the idea of having multiple names for the same command built
into DOS. Put entries in the command table for ERASE, DELETE, DEL,
and RM, all pointing to the ERASE code, for example. This saves
memory over the alias scheme (which I agree is better if you have the
memory for it) because the length and content of the built-in command
table is fixed at all times, while the alias table requires extra
handling code and memory allocation.

Another idea might be to use batch files for this translation, but
that would be inconvenient with Sparta's requirement of putting a '-'
before batch commands. (Could that requirement be eliminated in a
future release?)

Um, there are no Atari files with .gz - it is an extension signifying
compression with gzip, a (mostly) Unix-based program that also exists
in an MS-DOS incarnation. You can find Unix source and MSDOS
executables at ftp.prep.ai.edu:/pub/gnu.

I think gzip uses the same compression algorithm as ZIP, but a
different file format, so if it's possible to write an unzip for the
Atari, it may be possible to write a gunzip too.

Source record: 100485

Well, Jim, GEnie *does* have an Internet connection yah know. It isn't a direct USENET feed, I get all my info from the Digest which comes as regular e-mail. It has always been like this for me, even when connected to the VAX mainframe I still received the newsgroup as email in the form of the IA8 Digest. That's why my responses are usually delayed. I was completely disconnected from the newsgroup last fall/winter till Mike Todd took over & straightened out the Digest. Fortunately Marek Tomczyk forwarded me the Digests which was extremely helpful & kept me from falling off the edge of the earth. SB.COM is still on the net, but only thru the mainframe VAX. My hardwired port was disconnected from the mainframe on June 14. They've been moving ever more strongly to a LAN system for internal communications the past couple years which has left the VAX ever more isolated. Dunno if they'll ever hook up the LAN to the net when they finally trash the VAX. I don't even know if such a thing is possible. I never understood the darn VAX, much less all this LAN stuff. The GEnie interface is nowhere near as friendly as my old connection was, where I used VersaTerm-Pro on a Mac-IIci which was nice. Next I reckon you'll be telling me to dump GEnie & come on over to Delphi, right? :)

You could try double-buffering the display list, i.e. using TWO display
lists, one of which is being accessed by ANTIC while the other one is
being manipulated by your program...

3215. Case w/power supple for drives,projects

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-20 02:52:31 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0098034E.5A1B7120@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 100502
Cross-posted to: misc.forsale,misc.forsale.computers.other,misc.forsale.computers.pc-clone,comp.sys.apple2.marketplace,comp.sys.cbm,comp.sys.atari.8bit,sci.electronics

Note: Please reply as soon as possible, or by 6/30/94. Thanks!
==========

This case previouly contained a luggable PC-clone (Columbia 8088 VIP computer).

It is made of strong metal, painted light off-white/beige. It has a switching power supply, cooling fan, on/off switch, fuse (1.6 Amps), carrying handle, rubber legs, plastic legs, it is tiltable (2 positions).

The dimensions of the case are 8 1/2" X 18" X 16". Inside are the power supply and cooling fan (of course), hardware for installing 2 drives, 2 more metal cabinets each about the size of a drive (5.25" half height) and a CRT that used to be the monitor of the computer. The CRT can be removed and then there is a lot of room to install whatever you may need in there. (If your project/ application requires a CRT, it can be left inside, however I do not have any details about its specs, resolution and condition). I can even send along a metal frame that will support up to 2 full height 5.25" drives, in case you wish to install such a frame in the empty space inside the case.

There is a matching front metal cover that goes over the whole front and protects it from dust and shocks during transportation or at a time the devices in the case are not used or no access to them is required.

The power supply was strong enough to power a full-size motherboard with 2 expansion cards and 2 disk drives (older, power-hungry 5.25" drives), as well as a CRT (monitor). It is in good, working condition as far as powering the drives is concerned; the CRT power should also be ok, however I never tested it- because I had no need for it (but I do not think there are any problems).

This case would be a suitable choice for projects or for powering external devices. It has a lot of extra room for expansion.

Asking for best reasonable offer; all reasonable offers will be considered and all replies will be responded to. Suggested price: $25

Please send e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973.
Thanks for the interest!!

Please reply by 6/30/94.

Well, since you have a XF551 you -should- be using S-DOS just to get the
double-sided use you have paid good bucks for! I've been using it since
I got my XF551's and it is great for use with high-capacity drives.

3218. SpartaDOS 3.2g

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-20 05:41:01 UTC
From: cmwagner@gate.net
Message-ID: <2u3a5d$gks@tequesta.gate.net>
Source record: 100495

I received SpartaDOS 3.2g (manuals and everything), and it is alot better than using Atari DOS 2.5 or MyDOS 4.5, mostly because I like CLI.

All I need now is another floppy drive and I will be able to decompress some SCP diskettes that I have, :). Well they can wait. There does seem to be a few commands that have disappeared, I suppose to cut back on memory usage.

Like AINIT, which is no big deal, I go just do BASIC ON, CAR, and do an XIO command. I was wondering if there is any chance that there will be or is an XIO (like basic) command available via SpartaDOS? I suppose once I get into programming again (have to learn the weird architecture of the Atari) then I could write my own AINIT program. One question (more like a request), is there anyway that when a resident command is removed that there be atleast an external command (that supports disk swapping) to replace it?

AINIT does come in handy, and I certainely don't need it often enough for it to be a resident command. But there is a few commands that are not available in 3.2g but are shown in the manual (which seems to be a 2.0 manual -- no biggie).

I am all for conserving memory usage, I think it would be nice if any internal commands could be written as external.

Hey! Even in BASIC you can determine the status of the Sega controller [C] button (it's hooked up to one of the paddle inputs.. I think 228 is up and 0 is down, or vice versa.. and it's either Paddle(0) or Paddle(1))

What >I< wanna know about is the [A] and [Start] buttons..

"squash" is Phil Katz's larger compression table scheme.

The fault with your FIDO board lies not in the program, but in your SYSOP. There is a "simple switch" on the PKARC program which turns off "squash" compression. The switch is called something like "set PKARC to OLD" in the documentation, and will disable "squash" as one of the formatting options, and also -- I believe -- set .ARC compression to 8-bit words. If your FIDO Sysop is going to support ".ARC" compression, it is complete nonsense to allow "squash". ".ARC" should be set with the old switch on so that it is CP/M and 8-bit compatible. The whole --POINT-- of having ".ARC" in the first place is to allow a compression scheme that is available and "universal" to all machines. Using IBM 16-bit SQUASH format defeats this entire purpose. IBM callers will be using ".ZIP" anyway, so this makes absolutely no sense, whatsoever.

The answer to your problem is not that you need a 128K ATARI. The answer to your problem is that your FIDO sysop is an idiot! A "squash"-ing .ARC should never be used, since IBM users have abandoned ".ARC" as a compression scheme. "crunch" should be the highest that ".ARC" is allowed to go, and -- if at all possible -- .ARC should support 8-bit machine words over 16-bit machine words, so that it maintains its CP/M compatibility. Otherwise, it defeats the purpose of having a "universal" compression scheme that is common to "all" machines.

MYDOS does support 360K DS/DD on the XF551.

I do prefer SpartaDOS though.

Sheesh! What does it matter if it runs on an 800XL, ST, PC or a Vax?
As long as the board has the files and services you need, who cares???

I have uploaded my Ultima IV editor to the atari archive ftp site.
Here is its enclosed description:

Description : This is an Ultima IV Map editor. Its MAC65 source code is
included, along with an Ultima IV icon editor.
Author : Jonathan Lee(lee912@cs.uidaho.edu)
Requirements: 48K ram, two disk drives or one disk drive and a ramdisk.
SpartaDOS is currently required to edit the brittannia map.
The icon editor and other support programs are written in
Action.

-Jonathan Lee

By the way, to FTP files that contain capital letters on Delphi (or any VMS system), just put the file name in quotes. That also works for file names with more than one dot.
get "README"
get "README" tt displays the file on your terminal.

>level...
Have you tried the PADDLE(0) and PADDLE(1)? It may be that these extra buttons cause changes in the values on the pot inputs. That's the way to read the second button on an ST mouse plugged into the port. It all depends which pins on the port the buttons are conected to and how they are connected. There's 9 pins, 2 of which are +V and GND, 4 for the directions (up, down, left and right) and 1 for the standard Atari trigger, the extra 2 pins on the Atari end are for the Paddle inputs (2 paddles to 1 port). If the other 2 buttons on the controller are connected to these 2 pins then you SHOULD be able to read them with the PADDLE command. If so then pressing the button will return one value and releasing it another one. If this is the case then adding an extra 2 buttons to a standard joystick would be dead easy. If anyone were to write the software to take advantage of this you would not necessarily be

Double-buffering the display list is a good idea. "Maze of Agdagon2 $ges
both double-buffer screen memory and display lists for smoothness. Remember
to move the pointer within your VBI or the system VBI correctly.

What are you doing thad 4zashes the display? Can you add blank lines to the
top of the display? This will give you more time before the electron beam
starts tracing.

Note: Please reply as soon as possible, or by 6/30/94. Thanks!
==========

This case previouly contained a luggable PC-clone (Columbia 8088 VIP computer).

It is made of strong metal, painted light off-white/beige. It has a switching power supply, cooling fan, on/off switch, fuse (1.6 Amps), carrying handle, rubber legs, plastic legs, it is tiltable (2 positions).

The dimensions of the case are 8 1/2" X 18" X 16". Inside are the power supply and cooling fan (of course), hardware for installing 2 drives, 2 more metal cabinets each about the size of a drive (5.25" half height) and a CRT that used to be the monitor of the computer. The CRT can be removed and then there is a lot of room to install whatever you may need in there. (If your project/ application requires a CRT, it can be left inside, however I do not have any details about its specs, resolution and condition). I can even send along a metal frame that will support up to 2 full height 5.25" drives, in case you wish to install such a frame in the empty space inside the case.

There is a matching front metal cover that goes over the whole front and protects it from dust and shocks during transportation or at a time the devices in the case are not used or no access to them is required.

The power supply was strong enough to power a full-size motherboard with 2 expansion cards and 2 disk drives (older, power-hungry 5.25" drives), as well as a CRT (monitor). It is in good, working condition as far as powering the drives is concerned; the CRT power should also be ok, however I never tested it- because I had no need for it (but I do not think there are any problems).

This case would be a suitable choice for projects or for powering external devices. It has a lot of extra room for expansion.

Asking for best reasonable offer; all reasonable offers will be considered and all replies will be responded to. Suggested price: $25

Please send e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973.
Thanks for the interest!!

Please reply by 6/30/94.

3234. PC XFORMER 2.0 RELEASED (Atari 8-bit emulator)

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-20 21:24:37 UTC
From: darekm@microsoft.com
Message-ID: <Crpst3.pA@microsoft.com>
Source record: 100430

PC Xformer 2.0 - The Atari 400/800 Emulator For MS-DOS Compatible PCs
==========

June 20, 1994.

For more information write to:

Darek Mihocka, c/o
Branch Always Software
14150 N.E. 20th Street
Suite 302
Bellevue, WA 98007
U.S.A.

PC Xformer 2.0 is a free emulator for MS-DOS users who wish to run their old Atari 400/800 software. The file XF2.ZIP is today being released to the online services Compuserve, Delphi, and GEnie, and will also be available on other bulletin boards shortly.

The ZIP file contains the XF2 (PC Xformer 2.0) emulator, 10 pages of documentation, and various sample 8-bit programs.

PC Xformer 2.0 is NOT shareware. You can freely use it, just as the original ST Xformer program on which it is based on has been freely available for years.

Future upgrades of PC Xformer will be available for $29.95 for those people who want the additional features, extra documentation, and product support.

Features

Many of the limitations of the ST Xformer emulator are gone thanks to the much faster processing power of the PC and its superior VGA graphics capablities. If you previously used ST Xformer you'll find much faster emulation of Atari 8-bit programs with much greater compatibility.

PC Xformer 2.0 is the first and only Atari 8-bit emulator for either the ST or PC that supports all these features:

- 48K RAM with built-in Atari 400/800 operating system and Atari BASIC

- displays all ANTIC text and graphics modes, including GTIA modes

- displays player missile graphics (no collision detection)

- handles display list interrupts, IRQ, and NMI interrupts

- reads and writes to ST Xformer and SIO2PC generated disk images

- reads MS-DOS files directly and automatically converts to disk image

- switches Atari BASIC on/off with one keystroke

- joystick emulation using the keyboard

- full speed emulation on a 386/33 or faster

- slow and fast modes of emulation for faster PCs

Features that will be found in future versions of PC Xformer are:

- 800XL/130XE memory bank switching

- player missile graphics collision detection

- sound card, joystick port, modem port, and printer port support

The speed of Atari 8-bit emulation is proportional to the speed of your PC, with a 33 Mhz 386 approximately giving the normal speed of an Atari 800.

Below is a list of processors and the approximate speed of emulation relative to an Atari 800:

- 286/16 - 0.3
- 386SX/20 - 0.5
- 386DX/33 - 1.0
- 486DX/33 - 2.0
- 486DX2/66 - 4.0
- Pentium - 7+

486 and Pentium users can use the slow/fast option to slow down the emulator to normal speed.

Hardware requirements

PC Xformer 2.0 is a 16-bit MS-DOS application. It is designed to run on most PCs with minimum hardware requirements. It requires a 286 compatible CPU, so it is compatible with all 286, 386, 486 and Pentium based PC, as well as any PC that can emulate the 286.

PC Xformer 2.0 also requires a VGA compatible display, and about 200K of RAM.

For additional information see the documentation file that comes with XF2 or write to the address above.

- Darek

I care.. I prefer to call systems RUNNING on an 8bit Atari computer.

Having to emulate ASCII, ANSI or VT52 is annoying and I'd much rather
be on an ATASCII based system. If I want 8bit Atari support, I'll call
an 8bit Atari based BBS - not an ST or IBM based system.

How many people call Fido boards with a CP/M machine? Maybe a C=128 but
seriously. I don't have to worry about this problem thankfully.

In your case, Winston, I know you have been unwilling to upgrade and
would rather point fingers when there is something you can't do because
it requires 128K, whether it be this or the old CGS or what have you. I
think now that upgrading is so darn cheap that anyone who really wants to
get the most out of their 8-bit should just do it and stop looking for
workarounds. It's good that there are workarounds for people who are
just dabblers with hand-me-down 48K or 64K machines but to me, banked RAM
separates the men from the boys. If the userbase is so frightened of
banked RAM, then we'll never get people to buy into a 16-bit upgrade.

I dunno, there is a difference between frugality and living in the past.

> call
> an 8bit Atari based BBS - not an ST or IBM based system.

ATASCII can be done on almost any machine provided the Sysop takes the time to edit menus on an 8-bit then just dump them to the other system. Or aleast one that supports 8-bit data. I have to do just about the same thing with RIP graphics, I have to edit them on one machine then copy the the files to the BBS because RIP isn't a native mode on my BBS software. ATASCII isn't native to IBM's but it still can be used.

Chris - Paid $429 for a 1050 disk drive with Happy Board in 1985 <sigh>

3242. TurboWord -v- AtariWriter 80

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-21 02:58:17 UTC
From: kamaro_kid@delphi.com
Message-ID: <Jm4Qwcx.kamaro_kid@delphi.com>
Source record: 100416

Anybody out there actively using MicroMiser's TurboWord?

What's so great about it, save using the XEP80? I mean, I paid $50.00 for ATW80 and get full 80 col. WP.. Now why did I just buy this package of TurboWord?

Secondly, I'm not having much luck in setting it up for use with SpartaDos X and SpartaDos -- and I do have a Basic XL cart as the docs suggest using.

Any help/information greatly appreciated.

I tried to use it once to write a paper. I lasted about half a page
before I gave up and went back to PaperClip.

>What's so great about it, save using the XEP80? I mean, I paid $50.00 for
>ATW80 and get full 80 col. WP.. Now why did I just buy this package
>of TurboWord?

Other than the 80 columns? Nothing.
Since it's BASIC, it's very slow. I was typing at least a couple of
strokes ahead of it, and there were lots of lost keystrokes.
The menu redraws reminded me of calling a BBS at 300-1200 bps.

Since I have Basic XE (not XL), I thought of inserting a FAST command
at the beginning of the program, but it was in an unlistable format,
and I didn't have any Basic utilities handy to fix it.

I thought the days of commercial programs written in Basic went out
with the 410 recorder, but I was sadly mistaken.

It's possible that some of the speed problem was the XEP80's fault (I
never used AW80), but this was ridiculous.

I've got a nasty feeling I put local distribution on this post before...just in case (and as the response has been somewhat underwhelming) here it is again...

My emulator development has got to a stage where I now need to use a ROM image. I was going to use the AT800XL images, but I checked and they are revision B ROM's. I want the Rev C. I haven't got a dbl density drive for my atari, and haven't yet got to building a SIO2PC lead, so could someone provide me with a ROM image, please. Just straight binary of the complete ROM, pref. in a single file.

Thanks in advance, Zargwog...

PS. it will still be a long time before the emulator is even at Beta level, so don't get too excited just yet....:)

Message-ID: <199406211040.FAA29008@news.cs.utexas.edu>
Source record: 100426

SUPPORT FOR YOUR ATARI 8-BIT FROM RICHARD GORE.

YORKY 256K Memory upgrade:

I only have five full kits of this rare upgrade left, priced at #50 ($90)
plus p&p (#2 UK, #3.50 EC, #5 rest of World) including manual and support disk.
Yorkys are supplied ready built, all you have to do is plug them into the PBI
port of your 800XL and hey presto you have a 256k machine.

Once these units have been sold no more will be produced - now could be your
last chance to obtain a Yorky! Watch out for the mention in the April AC!

SOFTWARE:

JAWBREAKER - The classic Pac-man style game originally sold by Sierra-On-Line.
This version includes two mazes which were originally sold as
separate games as well as a new pause function and improved
joystick control. Two mazes on one disk at a bargain price!

MOUSEKATTACK - Another classic game from Sierra-On-Line. This game has you
trying to plumb the levels of Rat Alley. A very addictive game
featuring a one or two player (simultaneously on screen) mode,
new pause feature and improved joystick control.

Both games are available on disk, tape or Rambit Turbo tape (state which)
and are supplied with a printed manual.

Prices: #4.95 each or #6.95 for BOTH (UK p&p included)

(overseas please add #2 for airmail shipping)
(US dollar prices $10 each or $18 for both fully inclusive)

N E W S O F T W A R E! N E W S O F T W A R E!

In association with Visionaire software I am pleased to announce the
availability of two new games programmed in the UK.....

ARENA: An original puzzle game where you must place pieces of a wall in
order to guide a 'power pod' too its destination. It sounds simple,
but it has good graphics and is very addictive. A demo version appeared
on issue 66 of Page 6's disk, but this version is the full game with
50 levels.
Price: #5 ($10) XL/XE, Disk only.

BUBBLE ZONE: Enter the Bubble Zone and meet the challenge! Guide your tank
and blast the ever increasing number of bubbles, collect the

power ups, watch out for the holes. How far can you go?
Frantic arcade action, with top notch graphics.

Price: #5 ($10) XL/XE, Disk only.

US customers can buy both Arena and Bubble Zone for $18 including p&p.

For further details or to order contact:

RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

Telephone: (0302) 784642 weekends only please.

- -

SOFTWARE Authors, have you written any games or utilities for the Atari 8-bits, new or old? If you have and you have the rights contact me now and we can hopefully arrange to get them (re-)marketed!

- -

UK customers: Are you interested in buying the classic ICD/OSS products such as SpartaDOS X, MAC 65, ACTION!, BASIC XE, BASIC XL, R-TIME8?

If you are contact me and I might be able to help!

This will be the last time I post this list, as of today I will no longer have e-mail access (at least not until I can get another account - which might not be for a while) since my university course has ended. It is a sad day for me, but hey I've got the rest of my life ahead of me. Anyway just because I no longer have e-mail it doesn't mean to say I am no longer supporting the Atari 8-bit machines, far from it. The support WILL go on, I have several more classic games in the pipeline including Silent service, Summer Games, Winter Challenge, Gorf, Halley Patrol, Gato and Taxicab Hill (I've never heard of that one myself!). Prices etc are TBA but if you're interested write to me at the above address (and if you feel kind include an sae, IRC etc - if not don't worry I think I can spring for a stamp) and I will send you more details. Heres to the future and I look forward to mine and your continued support of the best 8-bit computer ever made.....

Richard Gore

I can tell you I never touched it once I bought AtariWriter 80. TurboWord
does offer lots of nice little features, but the editor itself just doesn't
compare to AtariWriter 80, IMO.

>Secondly, I'm not having much luck in setting it up for use with
>SpartaDos X and SpartaDos -- and I do have a Basic XL cart as the docs
>suggest using.

Back when I had Turbword running I was using MYDOS. I never tried it under
SpartaDOS.

3253. Textpro author wants to hear from you!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-21 19:38:40 UTC
From: jjmcwill@next5
Message-ID: <2u7fk0$jik@mtu.edu>
Source record: 100431

Textpro author Ron Riche is well on his way to releasing version 5.20
of Textpro, his word processor for the Atari 8bit.

Already, version 5.14 beata supports up to 65 simultaneous edit windows
of 16K each, 8 linked documents of 128K each, or any one of many
combinations in between. Textpro's macro language has evolved into a
highly sophisticated and powerful automation language.
In the last issue of Atari Classics, I talked about how Textpro's
macro language saved the day when I needed to print address labels
from my database on my inkjet printer.
The new add-in machine language module capability promises to make Textpro
even MORE powerful and customizable to the user's needs. Version 5.20 will have
no less than NINE hooks into various parts of the editor, file menu, and print
routine. One of the most exciting features to me is the include verbatim
command, which will allow you to include graphics, or long strings of control
codes, such as downloadable fonts, right in a document.

Further, if a company, or individual were to design a hardware 80 column
display card that allowed poking screen data directly into the display
memory area, Ron Riche says that Textpro would be extremely easy to turn into
a 80 column word processor.

With all these great features planned, you would expect that Mr. Riche would be
overrun with letters and telephone calls from people anticipating the
release of the program. Strangely, this is not so. The 8 bit community has
been so quiet over in his neck of the weeds in fact, that Mr. Riche is quite
convinced that no one is interested in Textpro anymore.

If you've used earlier versions of Textpro and found them to be useful, or if
what I've mentioned above has piqued your interest, then
I urge you to let Ron know that yes, Indeed, there ARE people out
there still interested in his program.
Without user input, there is little motivation for Mr. Riche to continue work
on Textpro. I'm sure nothing would make him happier than to discover that
we 8 bitters haven't fallen off the edge of the earth.

Here is his address.

Ronnie Riche

:
: I have an old 1200XL and would love to hook up my Black Box to it!

Thomas,

Aren't you the guy selling the 130XE? Hmm,well I don't blame you,
I much rather type on a 1200XL than a 130XE as well.

Yes, there is quite a nasty project which adds a PBI connector to the 1200XL.
Keep in mind, that as the PBI has 50 connections, so too do you have to solder
more than 50 wires inside your 1200XL to bring the PBI out.
The article was printed in the San Leandro Computer Club (SLCC) journal
quite some years ago, but I have it somewhere.

Along the way you end up adding a 800XL operating System ROM to the computer,
and optionally, internal BASIC as well.

I thought it was three: send data, receive data, and ground.

This is the minimum needed for rs-232 communication, so it's very
useful when you don't need all the extra stuff - and you usually
don't.

Jeff-

I was a registered user of TextPro. The only better word processor was the last version of PaperClip, but since PaperClip had its own built in DOS I couldn't load and run it under SpartaDOS X from my hard drive, I used TextPro most of the time.

At one point Mr. Richie announced that last version of TextPro was coming and offered to sell the source code to registered users. I sent a check which was cashed, but I never received a thing. I know the Postal Service can lose things, so I sent a followup note, which also went unanswered.

I sold my 8bit equipment a few months later and wrote off Mr. Richie's empty promise. I never did hear from him again.

Hopefully he has his act back together. TextPro is too good a word processor to be simply ripped off by its users.

Source record: 100444

Well, one of my posts showed up late, and another went to a different newsgroup. Apparently, the Portal system has been having some troubles. Excuse this message if it's a repeat.

>I like the idea of having multiple names for the same command built
>into DOS. Put entries in the command table for ERASE, DELETE, DEL,
>and RM, all pointing to the ERASE code, for example.

SDX uses a table like this, as well as the non-disk commands in 3.2 (like RUN, CAR, KEY, etc.). Unfortunately, the ERASE, RENAME, and all other CIO disk commands don't use vectors, and have a one to one correspondance between the command name and the function. It would require a complete change of the processing routine, as well as more memory, to provide this. Maybe in the future, but I didn't want to risk getting potential problems by making major changes this first time out.

>Another idea might be to use batch files for this translation, but
>that would be inconvenient with Sparta's requirement of putting a '-'
>before batch commands. (Could that requirement be eliminated in a
>future release?)

I'd like to eliminate the '-' character, but a far more significant problem remains. Sparta batch files are not able to pass parameters from the command into the batch file itself. So you can't enter a filename after the batch command. Ideally, this will be addressed some time in the future as well.

Thanks, Chris. That was exactly the point I was trying to make. Brand/Model
loyalty is great, but sometimes folks get carried away to their own loss. If
the Sysop knows/understands/loves 8-bitters, all is well.

>Chris - Paid $429 for a 1050 disk drive with Happy Board in 1985 <sigh>

Ha! I remember distinctly paying $449 for my first Atari 810 drive (and was
THRILLED to toss that crappy cassette unit in the rubbish!) :)

PC Xformer 2.0 - The Atari 400/800 Emulator For MS-DOS Compatible PCs
==========

June 20, 1994.

For more information write to:

Darek Mihocka, c/o
Branch Always Software
14150 N.E. 20th Street
Suite 302
Bellevue, WA 98007
U.S.A.

PC Xformer 2.0 is a free emulator for MS-DOS users who wish to run their old
Atari 400/800 software. The file XF2.ZIP is today being released to the
online services Compuserve, Delphi, and GEnie, and will also be available
on other bulletin boards shortly.

The ZIP file contains the XF2 (PC Xformer 2.0) emulator, 10 pages of
documentation, and various sample 8-bit programs.

PC Xformer 2.0 is NOT shareware. You can freely use it, just as the original
ST Xformer program on which it is based on has been freely available for years.

Future upgrades of PC Xformer will be available for $29.95 for those people
who want the additional features, extra documentation, and product support.

Features

Many of the limitations of the ST Xformer emulator are gone thanks to the much
faster processing power of the PC and its superior VGA graphics capablities.
If you previously used ST Xformer you'll find much faster emulation of Atari
8-bit programs with much greater compatibility.

PC Xformer 2.0 is the first and only Atari 8-bit emulator for either the ST or
PC that supports all these features:

- 48K RAM with built-in Atari 400/800 operating system and Atari BASIC

- displays all ANTIC text and graphics modes, including GTIA modes

- displays player missile graphics (no collision detection)

- handles display list interrupts, IRQ, and NMI interrupts

- reads and writes to ST Xformer and SIO2PC generated disk images

- reads MS-DOS files directly and automatically converts to disk image

- switches Atari BASIC on/off with one keystroke

- joystick emulation using the keyboard

- full speed emulation on a 386/33 or faster

- slow and fast modes of emulation for faster PCs

Features that will be found in future versions of PC Xformer are:

- 800XL/130XE memory bank switching

- player missile graphics collision detection

- sound card, joystick port, modem port, and printer port support

The speed of Atari 8-bit emulation is proportional to the speed of your PC, with a 33 Mhz 386 approximately giving the normal speed of an Atari 800.

Below is a list of processors and the approximate speed of emulation relative to an Atari 800:

- 286/16 - 0.3
- 386SX/20 - 0.5
- 386DX/33 - 1.0
- 486DX/33 - 2.0
- 486DX2/66 - 4.0
- Pentium - 7+

486 and Pentium users can use the slow/fast option to slow down the emulator to normal speed.

Hardware requirements

PC Xformer 2.0 is a 16-bit MS-DOS application. It is designed to run on most PCs with minimum hardware requirements. It requires a 286 compatible CPU, so it is compatible with all 286, 386, 486 and Pentium based PC, as well as any PC that can emulate the 286.

PC Xformer 2.0 also requires a VGA compatible display, and about 200K of RAM.

For additional information see the documentation file that comes with XF2 or write to the address above.

MSDOS has an internal command table, which contains the command, and memory location, and that is basically it. That makes aliases and multiple commands (that do the same) possible. How is SpartaDOS setup?

I believe there is a limit on command size, 8 characters, I think.

:
: I thought it was three: send data, receive data, and ground.
:
: This is the minimum needed for rs-232 communication, so it's very
: useful when you don't need all the extra stuff - and you usually
: don't.

Many older serial printers had a top speed of 1200bps, with some non or minimal buffered printers designed for 300bps. The R2: port drives these printers just fine as all they used were TX & RX signals crossed in null modem fashion (and signal ground as noted above of course)

Naturally any serial device that relies on hardware handshaking (CTS & RTS), won't work on this port.

From: krishna@max.tiac.net
Message-ID: <2uagbg$3gb@sundog.tiac.net>
Source record: 100451

Where can I find detailed info on how the 800XL vs. 1200XL keyboard is wired?

There was also a text file I lost which told you how to hard-wire a CX-85 keypad into an Atari 800 keyboard.

The purpose of all this is to try to make the 1200XL keyboard usable on an 800XL and hardwire the CX-85 into the 1200XL keyboard. Mount it in a custom built case and that would be far superior (IMO) than a Transkey (just no macros).

I do know the 1200XL keyboard has extra decoding circuitry onboard which is why there are (I think) fewer lines coming out of it than the 800XL.

The easiest way to make this work might be to rerout the signals and bypassing the onboard decoding.

3277. ASCII Fuji's

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-23 00:56:29 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940622175634.23419cbc@sonoma.edu>
Source record: 100355

Ok, you all may think I'm crazy for even posting about this, but I'm just curious as to what everyone's favorite ASCII-Fuji is..

To start them off, here's my favorite:

```
|||
/ | \ In ATASCII, I push the "/" and "\" closer and use the
left-side and right-side vertical control characters (^V and ^B)
```

Another I've seen is:

```
|||
|||
/ | \ I think in 80 columns, this looks too.. tall I guess..
```

I've also seem sone AtASCII ones which look really crazy.. I'll blow them up for ASCII:

```
# ## #
# ## #
# ## #
# ## #
## ## ##
## ## ##
## ## ##
## ## ##
```

And so on.. I just wonder what everyone's favorite is (and why ALL of you don't have one in your .sig's!? :))

3278. JPG question

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-23 01:03:09 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940622180321.23419cbc@sonoma.edu>
Source record: 100356

Ok, I think I understand how JPGs work in comparison to GIFs.. well, maybe not the compression, but the actual screens. They are made of 24bit RGB data. GIFs on the other hand are made up of up to 8bits of color data, and each of those (up to) 256 colors are any color out of 21bit RGB data.

Conversion from JPG to GIF on an IBM is a crappy, slow, boring process. (At least on a PS/2 :^))

I'd think that conversion from JPG to ColorView wouldn't be all that complicated. I know that IBM's CShow runs out of memory when it tries to do JPGs (on my 640k machine) and that DJPEG uses some large set of temp files (which I rarely have room for! :)).. I believe all of this space used by these two programs are to decompress the entire image as big as it really is, using all 24bits (or, perhaps the reduce them down to 21bits which is all VGA can use). Once it is decompressed, the entire thing is looked at, from top to bottom, and then a pallette is given to the image as best the program can see fit.

SO.. since us 8bitters aren't stuck with a stupid 256 color "must be palletted" screen like standard VGA, but instead have 12 bit, 6 bit, and 3 bit ColorView screens in which the images can be directly written to (with dithering and/or averaging, of course :)), I don't think a JPG program for the 8bit would be at all difficult..

UNLESS OF COURSE, JPG uses some memory-hog of a compression algorythm or something.. BUT, us 'hard-core' users have at least 64 or 192k of spare space (RAM upgrades), and many people have hard drives and/or SIO2PCs, so any extra decompression space can be used there!

SO!... who'd like to help Jeff Potter out with a newer version of JView!? :) :)

-just babbling because DJPEG is so damned slow and awful
-bill

3279. 14.4K on 8 bit

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-23 01:54:15 UTC
From: romer@access1.digex.net
Message-ID: <2uaq07$7o1@news1.digex.net>
Source record: 100357

Just a question. Now that I've got an 800 system up and running again (after years in the closet), how can I hook my Intel 14.4K modem to it? I've got an 850, which I understand only handles up to 9600 (fast enough in my book<G>), but the cables I have (one I used on my 1200 baud modem, another I just borrowed from the nice people at Toad Computers) don't seem to work. The modem responds fine, dials fine, but when a connection is made it just sits there. This is using Bobterm 1.10, 850 Express (unknown version number) and Amodem 6.01 at a variety of speeds from 1200-19.2... any suggestions?

3280. Re: FTE: wha-hoppen?

Newsgroup: comp.sys.atari.8bit

Message-ID: <Crty4E.3xr@utnetw.utoledo.edu>
Source record: 100360

Ok, first off, I have an elderly 3.2d version of SpartaDos... yep, no new upgrades yet... and won't be for a while until a couple bug fixes get made... these are probably pretty low priority, so I doubt they'd get modified in the near future, but as it stands, I see no reason (feature-wise) to upgrade.

Bug #1) "copy" apparently won't overwrite existing files in the new mod - I've always taken this feature for granted, but now that it looks like it's gone for good, it's SORELY missed!!! Maybe a flag could be set at startup: OVERWRITE=1??? For us SpartaDos and MSDOS (and Unix) users... Why was this changed anyhow?

Bug #2) drop...umm...ah...looks like one problem I frequently encounter WAS fixed - YEAH! Hmm... maybe I have to rethink this upgrade stance I made...

.. forget this bug thing for now... I think I'm going to be closely watching Sparta for the next few months. Sounds like some good ideas are coming out in the followups I've seen thus far and maybe (hopefully, possibly, PLEASE!) a new revision of Sparta isn't too far off?!? I am curious as to why the copy command was made non-standard though. Most of the other mods make Sparta more like MSDOS. I really didn't care if the command names were different, heck I use Unix, MSDOS, Atari Dos 2.6f, and Sparta - every one was a little different... although all allow copying over existing files...

Did you dial it manually with the ATDT command? Maybe it is configured so that it doesn't send a CONNECT xxxx message that Express or Bobterm can understand. Or it could be a defective modem. My first 2400 modem would dial but wouldn't connect to anything. I took it back, exchanged it, and I've been using that one for years.

There's been some talk in comp.os.cpm about building an IDE interface for CP/M computers. Someone might be able to adapt that to the Atari 8-bit.

Source record: 100367

Hi, I've been in contact with a person from Japan who'd like to purchase an Atari 8bit, at least XL with 64k but preferably with 256k.. also he'd like a disk drive. I told him that 1050 would probably be the minimum he needs.

If anyone's got one for sale and can ship to Japan, please e-mail me!

thanx

In a message dated 6-21-94, James King said:

"BUT, the graphics go all to hell when I load it up on my
machine.

I'm using an NCR 386sx with EGA video (NCR proprietary
cards, etc..)"

I suspect EGA is your problem. Unless the docs say otherwise, everything I have seen in Darek's message indicates standard VGA is the bare minimum video standard needed to PC Xformer.

(Dave asks why his 800, 850, 14.4k, BobTerm isn't working.)
Dave, you set the DTE rate with BobTerm, 1200, 2400, 4800, etc.
You gotta set the DCE rate with atn0<return> Ok. ats37=6<return> Ok.
for your modem. Otherwise the modem is at 14.4k and your computer is at
2400. Don't try to go over 4800, it won't work, I think.

(J. King says he's never seen a IBM or ST board with ATASCII screens.)
It may be true nobody has done it. But what the other guy was saying is
that it is distinctly possible to put any ATASCII screen, 40 col. stuff
you want in a IBM or ST BBS. You just prepare your ATASCII screens on
the 8-bit and then put them where you want them on the IBM or ST in the
BBS.

A little more about DTE, DCE. With a MIO or Black Box, you would set
BobTerm at 19.2k, the DTE rate, the rate between the computer and the
modem. Always set the DTE rate the highest that you can. You then force
the DCE rate at a rate the computer<->modem can handle with atn0,
ats37=6 for 2400 baud. The DCE rate is the rate over the phone line and
with data compression on (MNP or something), you can get rates up to
four times the set baud rate going over the phone line.

3292. Fractasia v2.0

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-23 15:10:25 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01HDVO4AE2CY8Y6GIC@vax.edinboro.edu>
Source record: 100373

I have decided to work on Fractasia v2.0. Fractasia (v1.57 is the current version) is a Mandelbrot set generator that would generate images that could be displayed with Jeff P.'s COLRVIEW program. Check the Archives for the current version: atari/8bit/Graphics/frac1.arc. frac2.arc is in the same directory and is really just sample images.

In the new version, I am correcting some quirks in the user interface and doing the usual bug fixing, but I would also like to add a bunch of new features. Some of which include:

- support for All COLRVIEW modes.
- 160x192x64
- 80x192x4096
- 320x192x8 (*)
- APAC support.
- Possibly Julia set generation and maybe Plasma clouds.
- Better support of MyDOS 4.5x, SpartaDOS X, and AtariDOS 2.5

(*) I don't have any info on this mode, but I am assuming that it uses the same method as the other two, but with one shade of Red, green, and blue, and the assorted combinations of each. I wont even be able to test it until I see JVIEW to make sure everything works.

I would also like to add the ability to do continuous shading from one color to the next in the 64 and 4096 color modes. I, however, do not know enough about color blending to know how to generate a (for example) slow transition between yellow..green...blue. Basically, I need to know how the Red, Green, and Blue intensities vary across the light spectrum. Anyone help me on this?????

Also, I am working on a way to generate Mandelbrot landscapes. I have put together some fairly simple tansformation routines, but I need a LOT of memory (or disk space) to update the .R.G.B screens simultaneously and non-sequentially. And though I have not coded it, I can guarantee it will be slow. Anyone interested in landscapes?

(If I could develop 16-bit integer routines, I would convert the whole thing to ACTION!)

Basically this post boils down to..... Is the 8bit public interested in a cool Fractal generator or is it a waste of time. The whole point from the start, was to create another application for COLRVIEW. I need input into a new version. Any suggestions, comments, or criticisms are welcome.

There might not BE any of those systems left anymore. I know that years ago I used to dial up some BBS's to d/l 8-bit files for my trusty old 800 and that those systems were built on non-Atari hardware. I don't seem to recall any problems about screen displays (ASCII vs ATASCII) but that was a while back, to be fair.

But you have one good point... if you call a BBS that is _built_ on Atari 8-bit hardware, you can bet the SYSOP is an 8-bit enthusiast and the files will likely show it.

How about BBS:Express! for the ST? It supports Atascii, I believe. If people really want Atascii then when I setup my board I will incorporate it.

I think they would be more satisfied with the support no matter where it is coming from.

I would be setting up my board on a 386, probably running WWIV, because you can get the source for it. :)

It used to be that

copy foo.bar foo.bar

that is, copying a file onto itself, would wreck the file. This is the bug
they addressed with SpartaDOS 3.2g. As long as the source and destination
filenames are different, you can still copy over existing files just
fine.

That is bullshit. The only non-8-bit BBS that supports ATASCII translation (the Atascii EOL) is Forem ST. There may be Forem PC, I dunno. You can't do Atascii unless there is a separate selection for ATASCII translation throughout. Theoretically you could throw Atascii screens in there rather than ANSI but it just wouldn't work in practice.

I was on a Forem ST board ONCE. Although it supported the ATASCII EOL, that was about ALL it supported. Absolutely no inverse and certainly no cool Atascii graphics characters.

: a new version. Any suggestions, comments, or criticisms are welcome.

I registered Fractasia but I don't use it too much at this time due to the fact that it ties up a CPU when it generates screens. One thing that Fractasia needs is the ability to save squashed like Jview.

I think opening up new forms of fractal images besides the mandelbrot set is important because the mandelbrot set can get boring in places and the hot spots have been pretty well explored.

It is also true that a faster method of getting ColrView fractals is to convert .GIFs already created on the IBM side. But hey, I do like being able to make my own.

In doing color gradations, you could TRY to use dithering (as an option) kinda like Jview for more pseudocolors.

As for memory constraints, my advice would be to opt for banked Ram before using the Ram under the OS as the latter kills SD diskbased compatibility. Of course, if you are still working with compiled TBXL then you will have that problem anyway, which IS a problem. For the long time I was on the MUX I simply didn't not run Fractasia because there is no SDX that will work with the MUX and I was not really keen on working off a MYDOS partition and the whole rigamarole of porting pics over to my sparta BBS partitions. Call it laziness. If that doesn't illustrate the necessity for a Muxable SDX I don't know what does.

For those of you who are new to Fractasia, the best method to employ is to use the chunky low rez mode to scan areas quicky and when you think you have found a hot spot, rerender it in CV15. That way you don't have to waste zooms with lengthy higher resolution mode render times.

I would never use the low rez mode for anything but this time saving measure, but it is very smart of Adam that he included them since they are so useful in this way.

I also disable Antic when I can do speed up rendering.

KENDRICK@sonoma.edu wrote:
: It saves in the following file formats:

: Graphics 9 (raw, uncompressed)
: Graphics 15 (raw, uncompressed - ie, MicroPainter (I think?))
: Graphics 8 (raw, uncompressed)
: ColorView (three files: file.R, file.G, file.B - loadable with ColrView)
: ColorViewSquashed (one ColorView Squashed (one filth CSView)

How about loading any of these formats and saving TO .gif format??? I'm assuming it works both ways, right? (I hope! This may just be what I've been looking for!) If it can't view these formats, when registering, do we get the other utilities (such as this ColorView and ColorViewSquashed you mentioned) so we can see this new Atari-happy image we've converted?

Also, what's your recommendation for a good drawing package for this 8bit? The best program I've found for general purpose sketching has been an old Compute! program that I did a few modifications to. Only allow the base Gr.3,4,5,6,7,and 8 modes, but screen sizes can be as large as memory can hold! (I've created a gr.7 screen using the bulky pixels of gr.3 scrolling across 4 screens! Yep, a virtual 160 x 76 GRAPHICS 3 scroller... kinda fun to tinker with, but I never had to time to bring it up to date with XE/AXLON support for HUGE gr.8 editing, etc. The largest Gr.8 scroller I could create was about 320 by 240 or 250 the way the program was laid out. I'd like to be able to use a few more colors though... 16 would be sufficient... hopefully output it to a .gif file (even if I have to run it through another program to transfer it) for other people/systems.

-Tim

PS: I KNOW I still have this program handy... I can dig it out (and find the name of the darn thing) if anyone's interested!

p >released "Super UnLHArc" program have failed. I have seen it listed in
p >the umich archive and have received it as part of the (Dutch?) Mega
p >Magazine (disk).

Yes, Mega Magazine is a Dutch Magazine, Freddy Offenga, a.k.a. Frankenstein of the H.T.T., puts it together. I've tried to convince him, that Bob didn't want SuperUnLHarc distributed. Can't remember if that was already too late. Most of the guys overhere are hard to convince that if the programmer asks you not to use/distribute it if they themselves think they REALLY need it. Freddy is one of them.

p >By Bob's good graces, I have been entrusted with the source code, so you
can bug me about it :-)

Consider yourself bugged.

No I won't bug you about ZIP/ZOO/ARJ, but I REALLY need some faxsoftware for my XE. (I know Bob Puff bugged you about this too. So that make's two of us :-))

h >The R-Verter does 19.2 as well...its just 2 chips and a few resistors.
h >
h >Ghoull

There is a way to get the 850 to do 19k2, or even split baud rates. But, the
850 doesn't really support hardware handshaking, so 19k2 will get you lots
of garbage. You had to poke some addresses on the 850 directly with the
speeds you wanted (2 bytes for each direction).

PC Xformer requires VGA. No other way to duplicate the colors.
VGA cards are cheap these days, worth upgrading if at all
possible.

But graphic intensive stuff isn't it's forte. I like it for file
management (esp. decompressing DCM files... woosh!).

But I've got a problem; it won't work on a 180K DD disk image.
Won't boot, and isn't visible as any other drive either. Handles
90K SD and a 140K ED DOS 2.5 master.

Does anyone out there remember a product for the Atari 8-bit called 'The Parrot', which was a box that plugged into the joystick ports? I remember a box with a microphone that you could whistle into and would display notes on the screen (after you had picked a key signature). Where could I find one? Suggestions? How about an IBM equivilant?

Thanks in advance.

3320. Fractasia v2.0

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-24 13:38:28 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940623171449.2341976d@sonoma.edu>
Source record: 100398

Hey.. I really liked the first fractasia, although I didn't use it much
(HEY, if you added in a routine which turned it into an alarm clock, then I'd
use it every night that I need to wake up early!.. I've made many alarm clock
programs, from simple ones which display the time, to complicated ones like
After Dark screen saver wanna-be's.. this is usually the time my 8bit is on
the longest (I sleep a lot :)) and it isn't doing ANYTHING but keeping time..
ok, so I'm too cheap to get an alarm clock!)

But seriously, yeah, maybe add a little routine which checks TIME$.. What I've
learnt well with TIME$ in TurboBASIC is the following:

ask alarm time in HHMM .. ignore seconds
reset clock from "1300xx" to "010000" otherwise it'll go past 12
(I usually set TIME$ in AM/PM numbers, so at 6pm I d 060000 not 180000
like I really should :))
at LEAST reset clock to "000000" when it hits "2400xx" (BTW: xx means
ignore the last two digits :) .. some things take up much CPU time
and a "00" seconds may be missed!)

Anyways, as for doing color gradienting.. well, if you know how RGB colors work
out in real life, then you should understand them more-or-less enough to work
nice gradienting into Fractasia.

R = bright red, r = dark red
G = bright green, etc...

R.. = red
Rg. = orange
RG. = yellow
rG. = greenish yellow
.G. = green
.Gb = bluish green
.GB = cyan (right?)
.gB = greenish blue
..B = blue
r.B = indigo (I'm recalling from ROY G BIV :) .. lets call it bluish pruple)
R.B = purple
R.b = redish purple (violet?)

And of course:
... = black
rgb = grey
RGB = white

These are in just 3 positions (1.5 bits?!) .. In the real world, you get
OFF DARK MEDIUM LIGHT not just OFF DARK LIGHT

I'd love to see a lot more ColorView programs appear! (I heard a rumor of a game!?)

With the addition of CV8 mode, and how good CV15 mode usually looks, there's becoming a whole new graphical 'world' us 8bitters can use. I just wish the CV modes were easier to 'install' (why not some nifty INCLUDEables or inline codes or USR'able things for us programmers to use (aka I want canned code!!!))

Anyways.. at LEAST I think we need some of the following:
a good CV mode scanning utility.. perhaps working off of ComputerEyes if it can hanlde it. Perhaps a hacked peice of hardware which we put between a video source (say, VCR on [PAUSE]) and the computereyes hardware which lets us select Red Green and Blue data only..!?!?!?
I heard rumor long ago of some European CV capture hardware which plugs into the cartridge port.. is this true?! (hell, the software can be built in! I just hope it's DOS friendly (aka works with MyDOS, SpartaDOS, AtariDOS))

More graphical generating programs like Fractasia.. perhaps some spiffy version of ChromaCAD.. By the way, I heard CCAD uses some 64 color mode or something.. is this true???!! If so, is it CV15 or is it some strange APAGrey mode or something? (I know if you stick two GR9 modes together you do NOT get 256 greys, but you also don't get only 16..)

Again, I want a JPG program :) :) :) (Once I get a better IBM, I'll end up JPGencoding all of my GIFs because SOME GIFs reduce down to about 1/10th (if it is very lossy) and usually about 1/3 or 1/4th size!!! I'll probably be too impatient to SIO2PC HUGE 100+k GIFs over to the Atari (AFTER having DeJPeGd them!) when a 15 or 20k JPG is the exact same thing!)

Perhaps an ANSI viewer or terminal in CV8 mode? But it would probably be SLOW.. It'd take mixing Flicker text mode and CV8 mode together.. whew!! We'd not have true colors probably (ie, not exactly the same colors as ANSI) or brights, but at least we'd have SOME color...?

Oh, and again :) Speaking of FlickerTerm, I'd kill to see a text viewer like READER (Col80 by Itay Chamiel) or even a text EDITOR!?! (perhaps Flicker mode can be added to TextPro 6.0? hehe)

Blah blah blah whine whine whine.. I gotta learn how to program better so I dont have to ASK for this stuff! :)

3321. SDX, MIO, and Gumby. (an oddity)

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-24 13:53:08 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01HDWKAHCV2Q8WXUHN@vax.edinboro.edu>
Source record: 100400

I seem to be having an interesting problem. For a long time now I have been using SpartaDOS X 4.20 with my 1-meg MIO. Every time I would enter the FORMAT screen w/ SDX and the MIO attached, I would get a flickering character at the lower left side of the options window. It would always go away after selecting the drive. It was not much more than a subtle annoyance until.....

I do a GUMBY stereo upgrade and the whole FORMAT screen goes nuts... flickering wildly. If I disconnect the MIO, the problem stops. (I also did a SuperVideo upgrade at the same time... but I can't possibly see how this would cause an adverse effect.)

I can't figure out what the problem might be. The only connection I can see is that the POKEY controls SIO and to format a disk is an SIO function.... But why would the built in format screen start flickering wildly??????
No other SIO operations seem to have been affected, and I can proceed with the format (which causes the screen to blank) without problems.

It's weird I tell ya..... weird.....

The only other difference is that I put it back together without the shielding. Again, I can't see the connection.

I know there is a SDX 4.21 ROM. Does anyone know if this cured the problem with the flickering character w/ the MIO connected? If so, it may cure my screen problems.

Any Suggestions???

-Adam Conover.

3322. "C:" Emulator?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-24 15:34:02 UTC
From: guenther@kirk.fmi.uni-passau.de
Message-ID: <2ueudaINNm1@tom.rz.uni-passau.de>
Source record: 100401

Hi there!

According to an ad in the German "Computer-Flohmarkt" a program called
'Super "C:" Emulator' can be purchased from one of the few remaining
8bit dealers. I know this program copies cassette games (my old originals)
to disk and makes them startable from there. Does THIS program have the
capability to make a boot-disk from the cassette or does it only have
the ugly (IMHO) menu method?

And, does anyone know if it copies the following games:

Atari UK: Tiger Attack
Zeppelin: Zybex, Draconus
Firebird: Warhawk

(and many more including Red Max, The Last V8, BMX Simulator, etc., but those
above caused the most problems)

3323. PC Xformer - very nice!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-24 16:06:30 UTC
From: combee@prism.gatech.edu
Message-ID: <Kke2kiSo4GcO067yn@prism.gatech.edu>
Source record: 100402

I just DLed PC Xformer 2.0 from GEnie, and I must say that this program is very nice. All of the 8-bit programs I tried, including several A.N.A.L.O.G. games and a few BASIC programs worked fine with only a few hitches. The biggest problem is that P/M graphics collision detection does not work. This made trying to play RAMBUG II interesting as all those bugs just flew through my zapper beam. There is also no sound support yet. Both of these are planned for PC Xformer 3.0, a 32-bit version that will emulate a 130XE.

If I get a chance tomorrow, I'll send the ZIP file up to the archive. I did get to see the swan/Fiji demo running on it at greater than full speed with all the DLI's, and it was so nice!

I'm assuming it's been re-released for some time now. They've been
advertising it, and so have B&C and CSS.

I _believe_ the Mars-8 plans included Action!, but I'd have to read the
press-release again to be sure. My impression was that most all of their
ICD/OSS products could be included on the Mars-8.

Whoa! Ease up there, James. What's the problem?

I don't think anyone here really cares one way or the other what boards you call. That's certainly your option and more power to you for it. Given your preference for ATASCII displays, it makes sense, too.

My only point at the beginning of this thread was that for file downloads, it should make no difference what hardware the BBS uses, as long as the SysOp supports you as needed. I concede that a board based on the 8-bit is more _likely_ to provide better 8-bit support due to the SysOp's preference, but I would't REFUSE to call another board simply because its hardware did not match mine. If that was the case, it would be tough to find ftp sites.

Have fun... and enjoy life. :)

I don't know if SpartaDOS supports environment variables like UNIX and MS-DOS and many other operating systems, but I would really like to see a NOCLOBBER variable, like UNIX. That way if it is set to one it will tell you that the file already exists, and if it is 0 then it would overwrite unless it is the source and destination are the same. Maybe Mike will read this and consider it for the next release. I bought SpartaDOS 3.2g from him and I always thought SpartaDOS was the best operating system for the Atari, it sure does beat a menu driven DOS like AtariDOS. So anyone know if he is selling the X cartridge?

That's too bad. Backing up to floppies is insane, but I guess there is no alternative on the Atari. I just bought a Tape Backup for my clone, and it really makes a huge difference. Maybe someone will come up with an interface and software? (It works through the floppy drive controller, so there might already be an interface).

I heard those MIOs put out quite a bit of RF interference, make sure that
everything is sheilded properly, especially the cable from the MIO to the
computer. You might need to build a cable, and the MIO itself might be
putting out quite a bit of interference, move it further away from the
computer. This is just what I heard from a friend who has an MIO, this
may or may not be your problem.

(Larry E. asks about 'Parrot'.)
The author of 'Parrot', Tony Ramos calls here sometimes. His e-mail
address is ramos.15@osu.edu or aramos@cis.ohio-state.edu.
He might be able to help you find one. I have it.

3330. Halle 94?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-24 20:00:34 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940624130035.2341a4f9@sonoma.edu>
Source record: 100310

Does anyone know if there was a Halle 94 'get-together' this year, or if there was, will be, or is a not-yet-released "Halle 1994" demo??

thanx

-bill

|> Ok, I think I understand how JPGs work in comparison to GIFs.. well, maybe not
|> the compression, but the actual screens. They are made of 24bit RGB data.
|> GIFs on the other hand are made up of up to 8bits of color data, and each of
|> those (up to) 256 colors are any color out of 21bit RGB data.

Yeah, right so far. Packing the 24-bit (16M colors) into 256 colors is
a problem that takes longer to work out than the JPEG decoding on some
systems (or so it seems).

|> I'd think that conversion from JPG to ColorView wouldn't be all that
|> complicated.

Not complicated, but real intensive on the number crunching. I've looked
into it. It's a bunch of Integer multiplies (several per pixel), which will
bog down the old 6502.

|> UNLESS OF COURSE, JPG uses some memory-hog of a compression algorythm or
|> something.. BUT, us 'hard-core' users have at least 64 or 192k of spare space
|> (RAM upgrades), and many people have hard drives and/or SIO2PCs, so any extra
|> decompression space can be used there!

As far as I can tell, we wouldn't be memory limited, it would just run like
a slug.

|>
|> SO!... who'd like to help Jeff Potter out with a newer version of JView!? :) :)

well...someone want to speak up? Write me the JPEG decoder and I'll mate
the COLRVIEW routines to it :^)

Sorry, JVIEW only decodes from GIF to any of those formats. GIFNCODE will encode GIF from Graphics 8, 9, or 15, but not in ColrView mode.

|> looking for!) If it can't view these formats, when registering, do we get
|> the other utilities (such as this ColorView and ColorViewSquashed you mentioned)
|> so we can see this new Atari-happy image we've converted?

Yes, I have been including copies of ColrSquashView with the registered JVIEW program.

|>
|> Also, what's your recommendation for a good drawing package for this 8bit?

RAMbrandt is probably the most powerful, as far as having all the bells and whistles (commercial prog from ANTIC). BBK artist is a good PD one.

|> 320 by 240 or 250 the way the program was laid out. I'd like to be able to
|> use a few more colors though... 16 would be sufficient... hopefully output it
|> to a .gif file (even if I have to run it through another program to transfer
|> it) for other people/systems.

Your scrolling multi-screen program sounds interesting. If you can save the output in GR.9 (16 shades of gray) and use GIFNCODE to make a GIF from it, I can show you how to use a sector editor to change the color definitions in the GIF header directly.

Chad Wagner (cmwagner@gate.net) wrote:

: That's too bad. Backing up to floppies is insane, but I guess there is no
: alternative on the Atari. I just bought a Tape Backup for my clone, and it
: really makes a huge difference. Maybe someone will come up with an interface
: and software? (It works through the floppy drive controller, so there might
: already be an interface).

Theoretically it is possible to use the ComputerEyes interface to backup to a VCR. Miguel Stefan who used to run a Carina board had written a primitive backup program to do just that. ComputerEyes usually comes in through the joystick ports from a video source but apparently it can generate a video signal as well.

Unfortunately he moved to Puerto Rico and he's only called internationally to Carina boards once or twice since the move about 2 years ago.

Bob Puff was going to do a VCR backup but decided it would be too unreliable. But sometimes the convenience of saving to one or 2 VCR tapes is more important than the reliability of 200 1.44 meg floppies.

Another backup solution is removable hard drives like Syquests and just doing a partition copy. However, that is rather expensive.

I think the new 21mb floptical disk drives would operate on the Atari if the Black Box were updated. Obviously this would be by far the most efficient backup solution. But Bob Puff hasn't commented on the possibility really.

Hutch (hutch@ilmen.lanl.gov) wrote:

: My only point at the beginning of this thread was that for file downloads,
: it should make no difference what hardware the BBS uses, as long as the
: SysOp supports you as needed. I concede that a board based on the 8-bit is
: more _likely_ to provide better 8-bit support due to the SysOp's preference,
: but I would't REFUSE to call another board simply because its hardware did
: not match mine. If that was the case, it would be tough to find ftp sites.

For what it's worth, I've been on ST boards that have 8-bit filebases and they are not updated very much. Not unless someone puts in an upload, but definitely not by the sysop. On the other hand, 8-bit sysops are the very types of people who are apt to belong to GEnie or CI$ or the Internet and thus are able to grab the new files as they become available.

For a while I was a member of both Delphi and GEnie. Today, GEnie remains the place to be to pick up new shareware from Jeff Potter, Clay Halliwell, Alfred, and Pab Sungenis. They upload to GEnie first, and thence it trickles out into the nets.

Likewise, an ST or IBM sysop, who may be well intentioned regarding the 8-bit, will likely be totally oblivious to what is going on, and 8-bit threads there don't tend to be very current. But on the PRO! net sysops can exchange files and thus further enhance the distribution system for new shareware.

Unfortunately the Carina net remains very isolated from the rest of the 8-bit community. When I talked about the new SpartaDOS it came as a great surprise to them. It is because of the dearth of the Carina network that I pretty much made a resolution not to waste my time there anymore, because Shadow really hasn't a clue what he is missing (isolated people usually DON'T) and hasn't taken the steps to crossnet into FOREM/PRO! or really make a drive to get Carina 3 finished.

KENDRICK@sonoma.edu wrote:

: Anyways.. at LEAST I think we need some of the following:
: a good CV mode scanning utility.. perhaps working off of ComputerEyes if it
: can hanlde it. Perhaps a hacked peice of hardware which we put between
: a video source (say, VCR on [PAUSE]) and the computereyes hardware which
: lets us select Red Green and Blue data only..!?!?!?

CE already supports ColrView by using filters off a videocamera, or you can spend about $100 on a composite > RGB splitter. Systems like ComputerEyes exist on at least the Amiga platform. I explored the issue of an electronic splitter and the Amigoids pointed me towards a device. It was just too pricey for me to bother with because I also have a problem with the jittering of freeze framed images on my VCR, 4 heads doesn't seem to matter. Only a Laserdisk would likely work right thus more cost...

If you would like to pool your resources (and anyone else with ComputerEyes could to) we could all push the updating of the capture software which Clay said he'd do for me higher up on his priority list, either by whining, or by sending him a little $ to give him an incentive. The capture software of ComputerEyes is ironically written much like how Clay writes, USR strings in AtariBASIC. It is fairly well commented. He has done a bit of work on it so far. A big thing to help IMO would be to save in squashed format.

I also suggested that he add a hook so that you could capture by pressing the joystick button. The reasoning here is that one is limited in subject matter that is physically close to your computer. But with a long joystick cord extension you could set up the camera a good 50' away (I don't know how far you can push it) and set up the graphics mode and the filename, and it would say "Press fire button to begin Red scan" and you have the camera ready with the filter wheel. You know that a Gr.9 scan takes X many seconds to scan and save to disk, so you press the fire button, wait that amount of time, turn the wheel, press the button, wait, turn wheel, press button, wait, and you are done.

Last time I mentioned that he didn't seem too keen on it :(

Obviously the easiest application for CE is to digitize color stills from magazines and posters.

Another issue is the status of ComputerEyes as a product. Personally, the electronics involved seems very very simple. Not much more complex than the Parrot digitizer of which clones can be made with a couple bux in spare electronics. I've come across people who would have liked to

tinker with CE (like Clay) but can't find one. For the unit to be analyzed and a cloned or remanufactured would be cool.

The European digitizer was PAL and thus of dubious use for us.

: More graphical generating programs like Fractasia.. perhaps some spiffy
: version of ChromaCAD.. By the way, I heard CCAD uses some 64 color
: mode or something.. is this true???!! If so, is it CV15 or is it some
: strange APAGrey mode or something? (I know if you stick two GR9 modes
: together you do NOT get 256 greys, but you also don't get only 16..)

I think it is Prizmy (i.e. page flipping rather than interlaced).

ChromaCAD has a bankrupt interface and too many of its screens are memory destructive to the others which is very frustrating. It's a hurculean effort to make good pix, but I really think it could have been done better, and #1 would be to avoid the stupid Forth FMS which also plagues the MIDITRACK system (and also Rambrandt).

: Perhaps an ANSI viewer or terminal in CV8 mode? But it would probably be
: SLOW.. It'd take mixing Flicker text mode and CV8 mode together.. whew!!
: We'd not have true colors probably (ie, not exactly the same colors as
: ANSI) or brights, but at least we'd have SOME color...?

The problem here is that the CV display leaves practically not CPU time leftover. I guess, just barely enough to detect abort keypresses on the display (the console keys).

A CV8 display would need to blit the characters which is a CPU hog as it is. Now, a CVFLICK mode, maybe, but that may be impossible. The only solution I can think of is to have the screen be able to toggle CV mode, so that it can show mono to load the screen, then toggle (in which during the CV display all you can do is look at it, no more incoming text). This would not work for ANSI animation or colorized MUDs and stuff.

Clay wanted to add PMG underlay/overlays to Flickerterm for blinkers and brights, but he realized that color was really not gonna happen. I guess Clay still plans on the PMGs, I haven't asked him about it because I'm primarily interested in the vt100.

3336. Re: UnLHArc

Ivo van Poorten (ipoorten@cs.vu.nl) wrote:

: BTW Why doesn't Bob Puff want his UnLharc program to be spreaded? It's a good
: program isn't it?

He's a perfectionist, that's why.

If he sat down and really worked with it he would have tried to added LH-5 support but he sees it as a major flaw that it will only do LZH and not LHA. I do too, by the way, but that doesn't mean it is buggy. It runs fine for what it does. But Bob knows that LHZ format is only slightly more common these days than ZIP 1.0 (which is also doable on the Atari w/out banked RAM).

It's the kind of thing where Bob feels if it can't be done RIGHT then it shouldn't be out there in a half-assed implementation.

He realized that LHA would take a lot of Banked RAM for lookup tables and just got overwhelmed by that, by the fact that LHA standards seemed to him to be in a state of constant flux. Since that point (LHZ is like 1990 or something) LH5 has become the standard and things are quite stable so that part of his reasoning for giving up has disappeared.

But Bob is only one man and thus may never return to it.

: wildly. If I disconnect the MIO, the problem stops. (I also did a SuperVideo
: upgrade at the same time... but I can't possibly see how this would cause an
: adverse effect.)

When I had my 1200XL upgraded to 256K one of the flakies I saw was random character's in specific places on the Gr.0 display. This was caused by a logic chip which had started to go. Replacing the custom ICs didn't fix it. The gumby draws more energy from the PS and this may have pushed one of the logic chips over the edge.

The elegance of MARS8 is that you will most likely avoid flakies like this. A string of jumper wires and all that jazz is just an accident waiting to happen.

The video hack probably didn't screw anything up but you never know.

If you don't have spare logic chips it could be a bitch to try to figure out by trial and error.

If you swap them all and it is still screwed then odds are you wired SOMETHING wrong.

>commands (that do the same) possible. How is SpartaDOS setup?

Part of Sparta 3.2 is set up this way. Non disk I/O commands like TYPE,
RUN, KEY, etc., have this kind of table. The DOS commands like ERASE,
RENAME, etc, have no routine addresses, and instead just use the position
number obtained in the command search as a parameter to a general DISKIO
routine.

>I believe there is a limit on command size, 8 characters, I think.

Nothing imposed by the DOS I don't think, but I certainly wouldn't want to
type in commands over 8 characters, or even up to that long.

I dunno. To me the Home Computer age didn't arrive for me until we moved into the couple hundreds for a 64K machine and not that "IBMish level" of pricing.

If people were willing to pay that kind of money then, and now, then they probably don't mind shelling out what it costs to get your average 486/66.

And if money was no option, I'd probably own an Amiga 4000 with a 50mhz 040 and a 24 bit video board and an Emplant.

But my combined savings and checking account would probably BARELY pay for it. So its back to praying each night for shareware programmers, FTE, and CSS to keep squeezing usefulness out of this computer.

There is nothing more depressing re: the 8-bit than knowing what it could do (albeit slowly--big deal) if only the software were written for it.

It isn't so much that I would jump ship because I felt the 8-bit archetecture couldn't pull off what I wanted to do with it as much as it would be because noone was going to write the software I need which is perfectly doable and that really hurts. That a few software projects (albeit ambitious) are the difference between making this hardware viable and forcing my hand to spend some major bucks on getting started with another platform.

: capitalized file names, so I'm unable to read those documents.

Just have a last minute addition to the comments thus far:
SOME sites (FTP) allow you to decompress "on the fly" before you download
or view the file online... instead of doing the standard:

mget thisfile.gz thatfile.gz all*.gz

try single 'get's instead without the .gz extender:

get thisfile
get thatfile
(and you're out of luck with the all*.gz... you'll have to get each
file individually)

: Suggestions? How about an IBM equivilant?

It's quite easy to make a similar device yourself from a few electronic parts... I did... also took some clunky Antic code and rewrote it for M/L years ago (all assembly). The original project was called "Talk is Cheap" in one of the mid-80's Antic magazine issues by Ed-something... oh-well. If you don't hear anything about the Parrot-box soon, let me know - I think I still have some of the plans written up in an Atariwriter file I submitted to Antic. Too bad sampling didn't catch on back then. I was really into it, but the BBS operators and such at the time looked at it as more of a demo and not a plug-and-play option. I wrote a little Chemistry program that used a few sampled audio pieces when it was booting up. "Nah, audio sampling's just for fun... it'll never amount to anything... we're not interested... etc." A couple VERY short years later came the Mac with sampled noises here and there, then the PC soundboards, Sun/NeXT/HP's, etc... ARGH! Damn, I was doing that YEARS before all the rest too...

From: ulf@antic.sub.org
Message-ID: <5RXaoylHS7B@antic.sub.org>
Source record: 100332

Hi Thorsten!

The so-called `Super "C:" Emulator' by KE is the same as the '"C:" Simulator' written by Ralf David. While the latter is the original version, the former is only a copy of it and most of the main routines were illegally taken from the 'Simulator'. Hence, both programmes provide the menu method.

I wrote an emulator that supports the bootdisk-method a few years ago. It's called 'LDS "C:" Emulator' and is still available from my company for DM 9,80. If you are interested, give me a call (04381/7678) or write to CLASSICS, z.Hd. Ulf Petersen, Pf 1103, D-24318 Luetjenburg. Of course, you can any requests to my e-mail address as well.

As for the Firebird games, the only emulator I know that is capable of copying them is a special emulator that was written by me. It was published in the old "ATARI-MAGAZIN" years ago. If you want a free copy of it, feel free to contact me.

Cheers,

Ulf

Tim,

Last week I had the chance to hook up a dumb terminal, so I null
modemmed it to my P:R: connection 800XL. It worked fine at 9600 baud,
but spaces started turning into apostrophes and other wierdness at
19.2kbaud or whatever it is. I'm of course assuming that the dumb
terminal was fully capable of the higher speed, you set it on a
built in configuration menu.

I finally got my Rverter working.... I guess I could crank up the
Rverter and the PR: connection... hooked together. and see what the
max speed is from THAT....

I sometimes see simple B&W video cameras (just cameras, not camcorders) for sale in the want ads. These would be nearly identical to the original CE cameras. They go for $100 or less. Since I've lent out my CE to Clay for the time being I haven't gotten one of these buy when I get it back I probably will because I can generate CV images a lot faster and more directly by capturing pictures out of magazines and such than I can through .GIF conversion, and obviously I will have more control over the subject matter.

|> With the addition of CV8 mode, and how good CV15 mode usually looks, there's
|> becoming a whole new graphical 'world' us 8bitters can use. I just wish the CV
|> modes were easier to 'install' (why not some nifty INCLUDEables or inline
|> codes or USR'able things for us programmers to use (aka I want canned code!!!))

The last issue of AC included a bunch of my source code. Unfortunately the file got truncated. I'll try to upload the entire file if there are any of you out there interested (the _really_ interested ones have programmed their own versions already :^). But I doubt you can create USR'able code without having an appreciation for where these 3 8K RAM buffers are located. You would have to know where your C, Action, or BASIC compiler locates itself and your program to avoid corrupting your screen memory (or vice versa, having your screen pokes overwrite program memory).

|> Perhaps an ANSI viewer or terminal in CV8 mode? But it would probably be

A viewer maybe, but a terminal most likely not. The DLI or kernel program that makes CV8 work must have priority, which would not allow you to let serial interrupts occur correctly. Didn't you read my article?!?!

Message-ID: <940625143051.2341b797@sonoma.edu>
Source record: 100345

I actually feel MUCH more secure about the good ol' Atari 8bits now that we have emulators being worked on and even finished! :)

I mean, when the sad day comes that my 1200xl can't take a beating like I give it any more, and when there ARE no more Atari 8bits, I'll still be able to USE them in some lame little cheap IBM Pentium clone <grin>, you know?

I mean, emulators will actually INCREASE the userbase.. People who long ago dumped the 8bit and now regret it will be glad to hear that they can run their old games like M.U.L.E. on their clones! (And I DON'T mean the crappy EGA no-sound-card versions of the games which were created for the PC platform back in the 80's)

Anyways.. Also, with the 7+ speed increase something like a Pentium processor gives an 8bit emulator, and with systems like Windows (EWW) and SoftWindows running on Pentiums and PowerMacs, we'll not only be able to mess with our Atari, but also read great groups like c.s.a.8 and download cool stuff from the networks AT THE SAME TIME! :)

I think the major things >I<'d like to see in an Atari 8bit emulator for the 'other platforms' would be cartridge readers (perhaps via COM port RS232 or via slots inside the PC/Macs) and perhaps all of those nifty upgrades.

What would keep an 8bit emulator from emulating an Atari 800XL with Gumby, switchable OSes and 4 Megabytes of RAM!?!?

BUT, back to the real world. I think what the Atari emulators like the AT800XL and PC X-Former really need (from just HEARing about them, not even seeing them :)) is sound support, controller support (why not make it convert PC or Mac mouse into ST or Amiga mouse!? .. why not make it convert PC stick into 8bit stick?) and of course XL/XE OS and upgraded RAM support/emulation.

Oh, and before I forget (going back into the future-world I've been imagining).. I remember Bob Woolley working on some APAC mode via hardware... literally GUMBYfying a GTIA chip (ie, you stack two POKEYs to get stereo, why not stack two GTIAs to get APAC Interlaced mode without software support in the background?).

Why can't the emulators have ways of programmers turning on ColorView and APAC modes or even Flicker-style 80 column modes and then not worrying about it!? ANYthing is possible!! When you run the program on a REAL Atari, it will of course need to turn on ColorView or APAC mode or Flicker 80 mode and keep those screens going via VBI/DLI (thus slowing down the system and perhaps rendering some options of the program unavailable), BUT!...when you run it on your PC or Mac, the software will KNOW it, tell the Atari emulator to turn on such&such a screeen mode, and then not worry about it, thus leaving some CPU time VERY free!

And perhaps with CV mode, it will actually USE REAL 4096 colors (this of course would require a 'better-than-VGA' card and monitor) or REAL 64 colors, not the interlaced trick like an Atari CV mode! I've gotten CV15 to come up fine in QBASIC on my IBM! :) It took a bit of thinking to figure out how to convert red green and blue data from the CV15 files into one of the 64 colors I set up on the IBM's palette, but it worked fine and looks great (no flicker!)

ANYWAYS.. perhaps I'm just babbling.. or perhaps someone will DO something with these ideas.. (I can only hope!)

What will of course suck is, unless people come up with things like PBI ports via IBM slots or COM ports, and SIO ports via COM ports and the like, people like CSS who make the cool HARDware will eventually LOSE their market because of emulator-users. But, as long as software is being made, and we have an emulator that does at LEAST Atari 800xl with RAM and drives, I think us 8bitters will be more or less set for life! :)

Maybe one day someone will make an Operating System with full multitasking and old-system (IBM, Atari, Amiga, C=64, Adam, Apple II, Mac, etc.) support!!? :)

-bill (who now wakes up from his dream) :)

Nah, I doubt that emulators will support the dongles which make 8-bitting so fun. They MAY support running carts via ROM images. I've heard of that being done...

Obviously they'd be able to run off the native PC hard drive so you wouldn't need a Black Box.

And they'd run off the PC comm port so you'd get high speed modem usage. If they don't do that it would be pretty dumb.

For controllers, yeah, they should find a way to support all the joystick stuff. As well as Gumby support, why not?

3370. Computer Eyes, ColorView, and Parrot / Parrot II

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-25 22:56:03 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940625155615.2341b239@sonoma.edu>
Source record: 100348

Hi.. I have a Parrot and a ComputerEyes, and I also have some problems :)

1) I really wish there were better color handling on a CE than filters! :)
2) My Parrot's disk is dead.. I can NOT use my Parrot for ANYTHING other than a doorstop! It WORKS fine, but again, the disk is dead so I have NO parrot recording or editing software!

SO! Is anyone working on better CE stuff (Clay Halliwell for example)? Or is that just dead!?

AND.. where can I get some (good) (PD-preferably) Parrot sampling and editing software or routines?

I guess what >I< need is a Mac or Amiga with all the cool hardware hooked up to it and then some good conversion software.

Also, are people still interested in my 8bit WAV -> 4bit Parrot (full Parrot file format compatible) converter??

Also, if you want to see a pretty smart Parrot (or other) sample player, check out PLAYcom.tbs in the COM_RUN ARCs. If it sees that the file is a Parrot file, you get all of your Parrot options (up to 9 samples per file, you can play them as a string like "121234554176" or whatever!), but if it can't tell what the file is (as long as it's a 4-bit sound file, it'll work right) it'll let you play it by bytes (you pick how much of the sound to play in bytes).

It's not SUPER, but during load-and-play it is verbose in what it's doing (unless you turn the quiet option on.. if I added one :) It's been a while).

COM_RUN is available at the UMICH archives somewhere (dont remember) and of course I'll put my sample file converter and another simple player up on the archives. At the moment they're in TBXL, but I'm thinking of converting them to both 100% BASIC (lose the TBXL routines.. ugh! :)) and Action! (ie, put up source as well as Binary Loadable compiled)

later- bill

(Sergey Kartaev asks some questions.)
But, the thing is, this msg. has bit 7 set. I didn't know you could
do that. Reading on my Atari, I get inverse of some language similar
to the language of #2. So, in reference to posting ATASCII, apparently
you can. Just translate the 155 eol to 13,10 or 10 or 13. I'm not
going to do it, wait!!! How about this character, (just tried to
write a char. above 127, no luck) but I don't know if that is my
IBM term program or the UNIX bbs that is preventing it.
Guess I gotta try it with my 8-bit.

: ATASCII translation throughout. Theoretically you could throw Atascii
: screens in there rather than ANSI but it just wouldn't work in practice.

Actually you can just throw in a ATASCII file, just have the software not translate, but true translation would be better. But if you want exact screens then you would have to limit each system to common graphic characters.

I have seen it done before with PETSCII, which is totally different from ASCII or ATASCII, the guy through in PETSCII screens, and did a few translation routines and that was all he needed.

No, that guy's message had graphics characters in the ASCII ^A to ^Z
range. These are normally not visible characters, at least in ASCII, but
for IBMASCII and ATASCII they have graphics characters associated with them.

The newsgroups will accept those, but they probably won't accept the
inverse graphics characters (which are pretty important for ATASCII)
which ARE above ASCII (127).

I could probably post an ATASCII screen here as long as I converted the
EOL to a NL and didn't use any graphics characters above 127 AND if you
configged your account so that you could be in ATASCII on the receiving
end. That's a lot of ifs..

3374. PC Xformer 2.0 avaliable at ftp site!!

I have the Following ST Item's for Sale. All listings are Multiple with a number (x) proceeding showing number of each Item.

PS=Power Supply: Opt=Optional: Inc=Included:.

(2x) 130XE's. PS Opt: $100 wPS/ $75 w/o PS.

(7x) 800XL's. PS Opt: $75 wPS/ $50 w/o PS.

(4x) 800's. PS Opt: $25 w/o PS.

(1x) 800 Upgraded with 256K Axolon Happy Compatible Ram Disk. 1 Pass copies with Happy Drive and Axolon Ram Disk. Has OmniMon. Pill Chip(?) for Dumping Cartridges to Disk. Button for Cold Boot. Two extra switches, one on/off switch for Pill Chip, one 3 Way for 800 OS/OmniMon/? System. PS Opt: $100 wPS/ $85 w/o PS.

(3x) 400's. PS Opt: $10 w/o PS.

(7x) 1050's PS Opt: $75 wPS/ $60 w/o PS.

(1x) Indus GT PS Inc: $75 wPS.

(3x) 810's PS Opt: $35 wPS/ $20 w/o PS.

(3x) ATR8000 PS Built In/Just the CPU Unit: $75.

(25x) MPP-1100 Printer Interface No PS Needed. Plugs into Joystick Port: $20 each.

(1x) Supra MicroPrint Printer Interface PS Not Needed: $25.

(12x) Atari Numeric KeyPads. Plugs into Joystick Port: $10.

(3x) XM301 MoDeM/300 BPS/Needs No PS: $10.

First Come, First Served. If your interested in any of this call Ben at (503)256-9974 24HRs or E-Mail me on the Internet at this address: bensmith@teleport.com

As far as I know it is still available.

In fact it is probably the only DataQue product that he can probably move at all, because his T816 project is dead.

Bob Puff was rumored to be developing one as well, but I think he gave up on it to save resouces for R:P: and such.

Message-ID: <2ul264$8d6@explorer.clark.net>
Source record: 100263

Hello I was wondering if there is any place the ANTIC disks or avalible
on the internet or by a BBS. I know there out in the PD and avalibe on
Genie but I'm not a memer of Genie nor do wish to become one just for a
those files.

I am willing to use ftp.clark.net (by ftp site) for this purpose and will
do most of teh dirty work. I have a few disks that I will be uploading.

I'm not sure how I would want to store them either as .arc or in there
own directories.

Thery should have the format either as
mm-yys.arc (10-89A for example)
or
mm-yy/s/files (10-89/A/*.* woudl be all the files for the October
issure on disk side a and
10-89/B/*.* would be all the files for the October
side B for example (/ is the directory divided)

If anyone would be intersted let me know. I am going to create a sub
directory called antic under the pub directory and under that create
a directory called uploads. So if you woudl liek to help just upload them
up in the format descibed above. Just create the directrory in the
/pub/antic/upload/ directroy and put the files in there are .arc the files
and name it as above. I will then move the files to the /pub/antic/8-bit
directory.

Glenn, I see the XF2 as a great way to get non-8-bitters and ex-8-bitters back into the community! Perhaps we SHOULD have a "comp.sys.atari.8bit.emulation" newsgroup (I'm serious about this!)

I'm actually pretty happy for one really lame reason, I can now show off Sludge and CoolTris to my non-8-bit-owning friends! >:^)

And hell, it does DLI's which in my opinion is the coolest thing about the Atari (that and it's sound and Operating System.. IBM OSes BITE! .. not to mention ALL of the other 8bit machines' OSes! I STILL can't get disk directories on Apple IIs, and that LOAD "$" crap on Commodore 64 was really stupid!) (For one, that killed any exisiting program in memory, and for two, the same thing can be done in Atari BASIC (which HAS no "DIR" command like TurboBASIC XL) with a small 'program' you can "ENTER" from a disk!:

```
CLOSE #1:OPEN #1,6,0,"D:*.*"
CLR:DIM A$(20)
FOR A=0 TO 0 STEP 0:INPUT #1,A$:? A$:NEXT A
```

- this would not destroy a program.. it'd clear variables and leave IOCB #1 open and end in an ERROR 136, but it's better than LOAD! :))

Anyways, I know a few people who'd like to play old Atari games on their IBMs. My friend has an IBM 486/33 (?) clone and Windows and 8 megs of RAM and has a collection of old (rather well made, mind you - made not long ago) Arcade games like Centipede and Missle COmmand and the like.. but he paid $30 bux for it and he said it'd probably at least require a 386, and I KNOW it'd require major RAM and HD space because it's in MS-Windows!

So, Glenn, I don't think you should get all upset because some of us think the XF2 is cool. Hell, I haven't even seen it yet and not only do I think it sounds cool, but I have a HUGE number of ideas which >I<'d like to see incorporated into newer versions! :)

Hehe.. now that I think of it, my friend paid about $30 for a collection of about a dozen old Arcade style games for Windows...

He could pay $30 for an entire Atari 8bit emulator running on his IBM.. sure, it's only 800 (he HAD an 800 when he had an Atari), and it's restricted in SO many ways, but it is WAY better than anything else out there, isn't it?

I've yet to see a newer version of AT800XL (what IS that anyways!? :) I mean, those documents are CRAZY and waste SOOO much space!!!!!!!!!)

I've yet to see the X-Windows Atari emulator out, but I'd LOVE to see it! :) I know the author has had some hard times lately and hasn't been all that interested in the thing (so he said not too long ago here on c.s.a.8), but I'm sure some other people could probably work on it for him / in his place, ya know?

Anyways.. I guess my reason for thinking the XF2 and all of the other emulators are so way-cool is I realize that Atari 8bits aren't being manufactured any more and they will one day die. IBMs on the other hand will be around for a long time (WAY too long, IMH IBM-hating Opinion :))..

Ok, I'll shut up now :)

later

I found an ANSI C program for calculating PI out to many digits. I'm positive this won't run with simple syntax fixes because it has long ints and stuff. But if someone wants to see if they can TRY to port it to ACE C or Action!, please do!

```
/*
** PI.C - Computes Pi to an arbitrary number of digits
**
** Uses far arrays so may be compiled in any memory model
*/

#include<stdio.h>
#include<stdlib.h>

#define FAR
#define Fcalloc calloc
#define Ffree free
#define Size_T size_t

long kf, ks;
long FAR *mf, FAR *ms;
long cnt, n, temp, nd;
long i;
long col, col1;
long loc, stor[21];

void shift(long FAR *l1, long FAR *l2, long lp, long lmod)
{
long k;

k = ((*l2) > 0 ? (*l2) / lmod: -(-(*l2) / lmod) - 1);
*l2 -= k * lmod;
*l1 += k * lp;
}

void yprint(long m)
{
if (cnt<n)
{
if (++col == 11)
{
col = 1;
if (++col1 == 6)
{
col1 = 0;
printf("\n");
```

```
printf("%4ld",m%10);
}
else printf("%3ld",m%10);
}
else printf("%ld",m);
cnt++;
}
}

void xprint(long m)
{
long ii, wk, wk1;

if (m < 8)
{
for (ii = 1; ii <= loc; )
yprint(stor[(int)(ii++)]);
loc = 0;
}
else
{
if (m > 9)
{
wk = m / 10;
m %= 10;
for (wk1 = loc; wk1 >= 1; wk1--)
{
wk += stor[(int)wk1];
stor[(int)wk1] = wk % 10;
wk /= 10;
}
}
}
stor[(int)(++loc)] = m;
}

void memerr(int errno)
{
printf("\a\nOut of memory error #%d\n", errno);
if (2 == errno)
Ffree(mf);
_exit(2);
}

int main(int argc, char *argv[])
{
int i=0;
char *endp;

stor[i++] = 0;
if (argc < 2)
{
```

```
puts("\aUsage: PI <number_of_digits>");
return(1);
}
n = strtol(argv[1], &endp, 10);
if (NULL == (mf = Fcalloc((Size_T)(n + 3L), (Size_T)sizeof(long))))
memerr(1);
if (NULL == (ms = Fcalloc((Size_T)(n + 3L), (Size_T)sizeof(long))))
memerr(2);
printf("\nApproximation of PI to %ld digits\n", (long)n);
cnt = 0;
kf = 25;
ks = 57121L;
mf[1] = 1L;
for (i = 2; i <= (int)n; i += 2)
{
mf[i] = -16L;
mf[i+1] = 16L;
}
for (i = 1; i <= (int)n; i += 2)
{
ms[i] = -4L;
ms[i+1] = 4L;
}
printf("\n 3.");
while (cnt < n)
{
for (i = 0; ++i <= (int)n - (int)cnt; )
{
mf[i] *= 10L;
ms[i] *= 10L;
}
for (i =(int)(n - cnt + 1); --i >= 2; )
{
temp = 2 * i - 1;
shift(&mf[i - 1], &mf[i], temp - 2, temp * kf);
shift(&ms[i - 1], &ms[i], temp - 2, temp * ks);
}
nd = 0;
shift((long FAR *)&nd, &mf[1], 1L, 5L);
shift((long FAR *)&nd, &ms[1], 1L, 239L);
xprint(nd);
}
printf("\n\nCalculations Completed!\n");
Ffree(ms);
Ffree(mf);
return(0);
}
```

Well... it doesn't work with the GTIA modes (9, 10, 11) or the newer
160x192 2 or 4 color modes... I have to go through GTIA-Sketch or the like
and cut and paste screens. I have another ANCIENT program from Antic (circa
1985 or so) that will let me draw in "gr.7+" (160x96 with 8 or 16 colors)
I might be able to dig out though...

- see why I'm looking for a new, all-in-one type of drawing program? -
(The only requirement -=> It HAS to be a scroller... I'm too spoiled by that
hacked drawer... sure it doesn't have any "circle", "oval", "texture", "text",
and other high-tech features, but the capability to draw beyond the typical
screen constrictions is addictive. At least I can output to a more-standard
image size... 320x200 or 320x240... now all I need to do is find a good GIF'r
to convert the whole image.) (BTW: yes, it has "fill" and "rectangle" I
believe... maybe a couple other feature too... just nothing too fancy!)

-Tim

3390. 1027 Printer Interface

Newsgroup: comp.sys.atari.8bit

Source record: 100270

Hello all!

I'd like to connect an Atari 1027 Printer to a PC.
Could someone please tell me what pinout the printer's interface
has and what 'protocol' is used?

Many thanks in advance!
Bye, Thomas.

P.S.: Please respond via e-mail since I don't read this group regularly

Haven't seen it mentioned here but according to a post in amiga.advocacy, Jay Miner, he who designed the Atari 8bit chipset, died on 20th June 1994.
A pity, he designed some great chips and probably had a lot more to give the world.

Did you ever try using #7 instead of #1? As far as I remember, #7 closes the
IOCB when an EOF is encountered. It's been a while, but I think that's right.

Or even
OPEN #7,6,0,"D:*.*":FOR A=0 TO 0 STEP 0:GET #7,A:? CHR$(A);:NEXT A

saves the DIM A$.

[Date ] Sun 26 Jun 94 13:18
[Subject ] Jay Miner

Jay Miner passed away June 20, 1994, at the El Camino Hospital in Mountain
View. The actual cause of death was heart failure, but it was the result of
kidney complications. A private memorial service will be held in July.

He'll be greatly missed and much remembered.

(E,R,O,A,S,P,N,L,F,<,=,!,I,J,.,+,U,^,Q,G,H,?,RET)

KK> What has this digest become? Should we just pull the plug and call
KK> it comp-sys-atari-8bit-emulation?

I wish I had the space to keep all of the machines that I have known and loved up and running, but time and the high cost of electricity prevent that. Emulators allow us one more measure of sanity, even if it's a poor substitute.

I have a short story for you. My first computer was an ... never mind, that's not germane. But in the early '80s I bought my first "real" computer, an Atari 800. (I won't bore you with the glowing praise, or price comparisons, or peripherals) I discovered bulletin boards less than a year later, and logged onto one called (of all things) _The Pirates Den_ out in sunny CA. This was one of those multi-support boards, and the login asked for your machine type:

---------- Snip! (Ow!) ----------

Please Enter Your Machine Type:

1) Apple][
2) Atari
3) Commodore
4) IBM
5) Other

Which? __

---------- Snip! (Ow!) ----------

I entered 2 and promptly got the response "Ha-ha, no more new wares for you!"

This was immediately after Warner had sold Atari, and I had no idea what it meant. If I had known, I probably would have still bought an Atari,

as Apples were (and are) very expensive.

I was allowed in, and for a month or so, I corresponded with a bunch of self-serving Apple][zealots who disdained all other systems, especially Atari. I suspect that they knew that the 800 was better, from the hardware on up, but just couldn't ever let the mask slip.

Well, over the years, I poured tons of money into my Atari system, only to watch support from all directions dwindle. I hesitated to buy any of the ST stuff from the Tramiels, since I had seen how they treated the 8bitters. No thanks. IBM eventually got the nod, despite it's obvious flaws.

And my Atari disks have been sitting on a shelf for years, waiting for this moment. Darek, I salute you! Now, where was that copy of DiskComm3 I had laying around here... it was here in 1985...

Here's a Windoze icon for those of you using XF2 in a window

WW> think all those boot disks can now become PC material!!

Most of my DiscComm'd stuff are ready for the bit bucket, but I'd
imagine that at least a dozen or so games will be workable. For my part,
I'd just like to get "Alternate Reality: The Dungeon", "Kampfgruppe" and
"M.U.L.E." working again.

I've been playing around with the carts that I had converted to files
years ago, and the results are mixed. This is just the first meg or so
of files I've tried, but in almost every case, there are some minor
video glitches. Only the Atari release are pristine. Joust works
GREAT!

My machine is a 386DX/40, 8MB RAM, 430MD HD, 512KB ATI VGA Wonder+.

Yes, I wrote GIFNCODE. No, it doesn't save "modified" images, but if you describe your format to me I might be able to do something. How do you know exactly how wide (or tall) your scrolling image is?

>Haven't seen it mentioned here but according to a post in amiga.advocacy, Jay
>Miner, he who designed the Atari 8bit chipset, died on 20th June 1994.
>A pity, he designed some great chips and probably had a lot more to give the
>world.

That's a pity. Condolences to his friends and family. The world is indeed a
much more colorful place thanks to Jay's work.

Source record: 100286

I just tried XF2 and was pleasently surprised. Seeing the Atari basic me remember something: There is a POKE in atari basic which will flip all of the characters upside down. Does anyone remember what it is? I'm just curious what XF2 will do basically.

Sen Patrick Can
ind00052@pegasus.cc.ucf.edu

Ps. Anyone remember a game called Andromeda? What the !@#$ was the point of the game? Also, what are you guys using PC Xformer for other than the novelty?

From: KENDRICK@sonoma.edu
Message-ID: <940627165640.23409eb5@sonoma.edu>
Source record: 100288

I'm pretty sure the syntax of INKEY$ in TurboBASIC XL is just this:

INKEY$ as a function, so these examples work:

```
PRINT INKEY$

A$=INKEY$

IF INKEY$<>"" THEN PRINT "Don't touch the keyboard!"
```

Another way of doing it (I guess I always do this because I forgot about INKEY$) is like this:

```
IF PEEK(764)<255 THEN GET N:A$=CHR$(N)
```

which should be identical to

```
A$=INKEY$
```

I think...

WHen location 764 has a 255 in it, it means the 1-key buffer is empty (or you type Shift-Control-A, but that's another story :)). Then since GET in TurboBASIC XL can receive from the keyboard / editor if you don't give it an IOCB # (like "GET #1,N") but it receives a byte value, not a string, you must translate the N into a string with CHR$().

Also, be sure any strings you're using have been DIMensioned! (In the above cases when using A$, a "DIM A$(1)" would do fine)

Aww man.. that sucks :(

You've got to wonder some things though, did he ever see really how far his design has gone thanks to awesome programming like Jeff Potter and others do!?

Also, how old was he?

This really sucks. Oh eheh, also, I wonder if he ever caught that picture of himself in one of the Hobby/Halle demos (I forget which) .. the programmers thanked him personally and said how great the Atari's are still working <fzz fzz> <screen goes crazy> 'just kidding!' :)

Anyways, a moment of silence, eh?

I've got a rather sad story related to that. Jay did an online conference on Delphi in 1991 I believe regarding the Amiga 3000 I think. This was when he was still more involved with C=. I found a transcript of this conference in late mid to late '92 when I was on Delphi and there was actually some questions regarding the Atari 8-bit.

Someone mentioned something about Action!, like whether Jay had ever programmed in it, and Jay said he had never heard of Action!. Action was released in 1983! So from this you can determine that after he had completed the Atari 400/800 GTIA he disassociated himself from Atari.

In my tenure as a Carina sysop I was naturally close to David Hunt. Now, either the guy is a schizophrenic lunatic, or he was indeed, as he says, part of the Atari design team in the '70s. He said he worked side by side with Jay. Now, we all create cults of personality, but according to David, Jay was not the easiest person to deal with.

He said that Jay really lost interest in the machine after he finished with it (I can't comment on Jay's Amiga years, they are different because the Amiga was being revised and the Atari never really did get revised graphically).

He said he kinda locked himself away in a room and came out with his stuff. He liked to work alone and didn't fraternize much. I had languished for a little bit in the Amiga sig on Delphi and asked the sysop there if there would be any chance of me contacting Jay. The sysop told me that he indeed had access to Jay, but would not help me get in touch with him. At the time I wanted to do an extensive retrospective of Jay's career with Atari covering the 2600 and the 400/800.

It was not to be.
The sysop told me that he was not involved with C= anymore and was rather designing hardware for the medical industry.

Then I got info that he had a BBS but I never got the number. If he actually answered feedback maybe I could have piqued his interest since he was out of the Atari loop for 11 years.

After what I heard about his personality from David, I just didn't have the desire to fight and fight to possibly get bitched at for invading Jay's privacy.

We really should have a tribute article written...

More to the point, such an article would be best presented in a major magazine such as Compute! or Byte. The best we can do is to try to pressure one of the big magazines to publish an article we come up with, and in the process getting the mainstream public to see how the Atari machines are part of a lineage which is still alive and well and wowing us with great graphics.

I know John Harris has followed Jay's work, and also his disciples' work, of which I _believe_ the SNES and the 3D0 fall under. It would be nice if John wrote the tribute article which assesses Jay's contribution to the computer industry. Certainly he has the most "name recognition" due to his past as a commercial game programmer and the book Hackers... I mean, the mags might just raise an eyebrow (if he were interested in doing this of course).

3415. Still looking for 800xl or 65xe!

I got FIVE XF551's to sell.

FOUR of them are in excellent to pristine condition.

One is a junker, the mech is fine but the controller card is shot.

All units come with power transformer & SIO cable.

The functional units are $45 each, plus shipping. US buyers only, please.

The junker is $25 (the mech alone is worth that much), plus shipping.

junker for free (source of spare parts!).

I don't have manuals for these but will include a copy of the page showing the switch settings. The manual was the Atari DOS 2.5 manual anyway. BTW, of the 4 working units, 3 of them are later production with bolted-down SIO sockets. Sockets in the other unit are secured with solder-filled rivets, which seems pretty secure. All units have been tested/verified.

For another $10 I'll toss in a copy of the schematic for the 551.

Cross-posted to: rec.games.video.atari,alt.games.lynx,comp.sys.atari.st,comp.sys.atari.8bit,rec.games.video.misc

CLEVELAND, OHIO is 500 miles within HALF of the population in the United States and a very LARGE population of Canada.

The CAIN Atari Fun Fest 94 will be held in Kirtland, Ohio (very close to Cleveland) and will allow Lynx and Jaguar owners to have a lot of fun! There will even be a "Cleveland Lynx-Up" where Lynx owners can bring their Lynx and game cards and comlynx with other players! Who says that you'll never get the opportunity to comlynx???

There will also be dealerships attending this show that will be more than happy go give you great dealers on game systems and game cartridges!

If you are an Atari computer gaming fanatic, not to worry! There will dealers there to supply you with all your computer gaming needs...

ALL INTERESTED ATARI DEALERSHIPS AND USER GROUPS SHOULD CONTACT THE SHOW ORGANIZERS AS SOON AS POSSIBLE! Great spaces are on a first come basis! Atari user groups are given tables for free!

PLEASE distribute this on BBSs, networks, and at your user group meetings! We want to have one heck of a gaming day! And a gaming day that might be closer to you than you think!

CAIN Atari Fun Fest 94

Central Atari Information Network
Presents
C.A.I.N. Atari Fun Fest 94
August 7, 1994 / 10:00AM to 5:00PM
Knights of Columbus Hall

Source record: 100299

The comments to the effect Jay didn't keep up with the Atari are true. I read an interview with him in the late 80's in Analogue or Antic or somesuch and any question that related to Ataris beyond about 1980 was met with 'Don't know'. As far as I could tell he basically designed the chips and left. Now, this is open to dispute but I'm *sure* in the interview he says he wrote Star Raiders as a test of the hardware and wrote most of it before the chips even existed! Others say he didn't and someone else wrote SR. In theinterview, I remember him saying he was a hardware person (obviously) but knew enough code 'to get by'. He also said the 3D routines were done the hard way with lots of maths as at the time, the state of the art in 3D algorithems was about zilch.

Ooops....typing with my mind shut again 8^)
Bizarre use of variables aside, this does work - on EOF, IOCB #7 automagically closes itself.

Geoff

... Any resemblance between the above views and those of my employer, my terminal, or the view out my window are purely coincidental. Any resemblance between the above and my own views is non-deterministic. The question of the existence of views in the absence of anyone to hold them is left as an exercise for the reader. The question of the existence of the reader is left as an exercise for the second god coefficient. (A discussion of non-orthogonal, non-integral polytheism is beyond the scope of this article.)

3424. XF2 & virtual disks

3426. How fast will 8-bit go?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-28 14:40:56 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Jun28.103425.16063@wariat.UUCP>
Source record: 100300

I just did some tests of speeds out the SIO and PBI.
I got a reliable connection setting BobTerm 1.2 at 19.2k and doing
an upload which got about 1024 char/sec thruput (10k baud).
With the P:R: connection, 19.2k was not reliable just typing on the
keyboard, but 9600 works ok. P:R: connection had a 650 char/sec
thruput for about 6.5k baud.
For printer speeds, the MIO can do about 20k baud to its' buffer.
A UPrint buffer will load up 20k in about 18 seconds or about 11k baud.
The theoretical limit on the SIO is 19.2k baud, which makes me wonder
how the R:P: is going to go faster than that.
I think the limit on the PBI is 115.2k baud.
What I'm saying is that the SIO communicates at 19.2k baud and the PBI
communicates at 115.2k baud, so any use of these ports will necessarily
be limited by how fast the port is communicating with their chips.

(Russ G. responds to himself.)
The screen will put out about 500 chars/sec (5k baud).
With Doug Woukon's accelerator, it goes about 1300 chars/sec (13k
baud).
The fastestest I've been able to get two XT IBM clones doing null modem
is 4200 char/sec (about 42k baud). The XT does about a 10k baud or 1000
char/sec screen print.

3430. Re: How fast will 8-bit go?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-28 20:37:19 UTC
From: jjmcwill@next5
Message-ID: <2uq1lv$4vk@mtu.edu>
Source record: 100209

```
: I just did some tests of speeds out the SIO and PBI.
: I got a reliable connection setting BobTerm 1.2 at 19.2k and doing
: an upload which got about 1024 char/sec thruput (10k baud).
: With the P:R: connection, 19.2k was not reliable just typing on the
: keyboard, but 9600 works ok. P:R: connection had a 650 char/sec
: thruput for about 6.5k baud.
: For printer speeds, the MIO can do about 20k baud to its' buffer.
: A UPrint buffer will load up 20k in about 18 seconds or about 11k baud.
: The theoretical limit on the SIO is 19.2k baud, which makes me wonder
: how the R:P: is going to go faster than that.
: I think the limit on the PBI is 115.2k baud.
: What I'm saying is that the SIO communicates at 19.2k baud and the PBI
: communicates at 115.2k baud, so any use of these ports will necessarily
: be limited by how fast the port is communicating with their chips.

Well, I tried to do a test of my own, and here's what I did and what I
observed.

Machine 1 was a 800XL with Newell 1088K upgrade, P:R: Connection, SpartaDOS-X
and the Rtime-8.

Machine 2 was a 1200XL with Newell 256K upgrade and Rverter, and SpartaDOs 3.2d

the computers were null modemmed together.
Machine 1 used the RS232 driver built into the SD-X cart.
Machine 2 used the Rverter.com driver that came with Bobterm 1.2

Both machines were running Bobterm 1.22

The test file was a Genie captured text file from years ago, measuring
41635 bytes in length.
In all cases, it was read from the Ramdisk on machine 1, and sent
to machine 2. If it was saved, it was saved to the Ramdisk on machine 2.

First test, Ascii send (option 7 on the Bobterm send/receive menu)

Speed setting transmission time computed CPS
--------------|---------------------|-----------------
19.2K | 75 sec | 555 cps (unreliable data)
9600 | 77 sec | 540 cps
2400 | 178 sec | 234 cps

Second test, Ymodem batch send (option 5 on the Bobterm send/receive menu)

Speed setting transmission time computed CPS
--------------|---------------------|-----------------
9600 | 65 sec | 641 cps
```

2400 | 196 sec | 212 cps

I used the Jiffy timer at the top of the Bobterm online display to time all transmissions. What struck me funny was that Ymodem batch was more efficient than a raw ascii send at 9600 bps. Maybe it had some sort of adverse effect on the jiffy clock at 9600?

Either way, my figures averaged for both raw ascii and ymodem batch transmission times seem to agree with Russ's measurement of about 600cps for the P:R: connection.

Now for the interesting part, if a person owns an older modem, and say a P:R: connection, Rverter, or similar SIO based interface, what is the most cost effective way of upgrading?
Keep the SIO box and deal with a slower rate, or purchasing an MIO or Black Box AND a new Modem?

Old modem New modem %increase modem interface total increase per
cost cost cost dollar spent

300bps 14.4k $135.00 $ 00.00 $135.00
53cps 600cps 1132% 8.39%

300bps 14.4k $135.00 $180.00 $315.00
53cps 1000cps 1887% 6.00%

1200bps 14.4k $135.00 $ 00.00 $135.00
106cps 600cps 566% 4.19%

1200bps 14.4k $135.00 $180.00 $315.00
106cps 1000cps 943% 3.00%

2400bps 14.4k $135.00 $ 00.00 $135.00
212cps 600cps 283% 2.09%

2400bps 14.4k $135.00 $180.00 $315.00
212cps 1000cps 472% 1.50%

Of course, some of the numbers are kinda goofy.
If you get what I did, i compared upgrading from a SIO R: port to a Black Box and modem, or keeping, say the P:R: connection, and just purchasing a modem.
In this case, I used $135.00 as the cost of a US Robotics Sportster 14.4 external as the cost.
I used Russ's CPS rate for the MIO, but the price of a Black Box.
One has to ask, is the extra 400CPS worth the $180.00 for the Black Box?
It might be, that's for 170% the performance of staying with the P:R: connection.
What I wonder is... the US+ OS and SpartaDOS up the SIO speed for the disk drives, can the same thing be done for the P:R: connection, and could that make data transmission reliable at 19.2k???
For me, owning a P:R: connection and a 2400 baud modem, simply upgrading the

modem and running it at 9600 baud is tempting enough.

I've been told ftp.clark.net on /systems/msdos/emulators/xf2.zip

While we're on the subject, are there any applications which
have been moved to disk images readable by this emulator? It's
a nice emulator - I'd like to see it do a few things, maybe
just a little more than what's currently on the demo disk...

(Ideally, I'd like to get Star Raiders on it, but maybe that's
a little too much to ask)

I guess I just don't quite understand how this is implemented.

Re: cost benefit analysis.

If you are planning on using the BB for more than modems, sure it is
worth it. But for those who solely want to jump to 14.4 and don't want a
BB, or those who have an MIO and can't get reliable 14.4, obviously there
is a hardware gap, which the R:P: was designed to fill.

I can't imagine that the R:P: will not sell when it comes out. It really
fits in well into its niche as a cheap way to go HS.

That's definitely one thing I prefer about the 8-bits. Ever try to
format a floppy on a Unix machine?
mediainit -i 2 /dev/rfloppy/c201d0s0
You start to remember long strings of gibberish like that when you
format a few disks.

I have an eprom burner for my atari 8bit, & can save an image of an atari cartridge to disk with it. What I'm looking for is a program that will convert that to runable disk copy, so I can use the games on my old cartridges with the new XF2 emulator. I might be able to figure it out myself, but don't really want to relearn a lot of that stuff if I don't have to. I looked in the atari archives, but not having descriptions for most of the files, it feels like looking for a needle in a haystack. Is there an index to these files with descriptions that I missed?
Thanks for any help.

David

I have a two programs. The first is written by David Young - it's in
basic. It uses the 2nd cartridge slot on an 800 to do the job. The
second is a copy cart binary program that made exe's out of cartridges as
well. As far as something that will convert the image to a executable I
don't know. I also temporarily have a problem with getting either of
those cart copy programs to an archive sine I don't have a working 850 at
the moment.

(D. Bunch wants to use old carts on xf2.)
Sour grapes. But I don't have a 386. I don't think we're going to get very far with games without collision detection. It will be a nostalgic look at the graphics maybe. D. Michoka (pardon if mispelled) is a wizard to do this and if it is upgraded to include collision detection and the other things he mentioned, MAYBE some market for it, maybe a huge market for it.
David's question: No Dave, you can't use those disk copies of your carts. 99% are copy protected and you can't emulate the copy protection I think. There is nothing that is going to remove the copy protection except repeating a lot of cracking that has already been done. Essentially, the carts check to see if the cart is there. Don't think so Dave. The way I do disk loads of carts is with a cart copier that uses a dummy cart.

Huh? I've seen messages from many people looking for it,
very few finding it so far.

> Give me a break! As good as Dareks program is.. I'd still
> rather use the real thing than fake it.

Have you seen it yet? Nothing spectacular in 2.0, but far
beyond the ST version. Does some things very well; it's quite
promising. I agree a real 8-bit is great, but an emulator does
have it's place.

>
> What has this digest become? Should we just pull the plug and
> call it comp-sys-atari-8bit-emulation?

Again, I guess I'm not reading those messages. Is my site behind
the digest? If so, I'll retract this... Calm down, it ain't that
bad.

Message traffic varies, csa8 is sometimes very quiet. If the
regulars aren't posting and a few people come asking about the
just released emulator it may look like everyone's converted.

No doubt many PC users have fond memories of the Atari. Perhaps
an emulator can renew their interest in the real thing.
Possible?

3442. 14.4K ON THE 8-BIT (P:R:C)

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-29 04:16:31 UTC
From: b.poehland@genie.geis.com
Message-ID: <199406290416.AA169133367@relay2.geis.com>
Source record: 100219

Regarding the comments made about the P:R:C....

YES, there WAS more than one version of the P:R:C! At least 2 different versions: REV 3 and REV 4 boards. The two boards are totally different. REV 4 has an extra chip or 2 & draws more current.

BUT... REV 4 is the one you want. I had 2 REV 3's & dumped them. REV 3 had bugs, I mean big-time. The way I discovered it was by using KERMIT. When you use KERMIT with a REV 3 PRC, you lose your connection when you switch to local mode. Rather a disaster, since you have to go to local any time you want to upload or download something. Drove me crazy, as I was using several different PRC's at the time-- some were REV 3's & others were REV 4 so it didn't always happen. One day I brought them all home & opened them up-- & HA! That's when I found they were different. Further testing with KERMIT clearly showed the REV 3 boards contained the fault, so I got rid of them.

I called ICD about this to bitch, but they denied everything. They didn't even acknowledge there was more than one version on the market, even tho at the time I was holding the two different boards in my hand on the phone. I pointed out their manual shows a REV 2 board on the cover, the guy denied it & said the REV version didn't mean anything. Liar, liar, pants on fire!

ICD also denied there had been more than one version of the custom surface mount ROM in the PRC, but that also was a lie. They named the ROMs according to the date they burned the code, early ones were called PRC9985-6. Later ones ones had a different date code after the PRC... part, like PRC112486. They knew there were bugs in the firmware & fixed them in later versions of hardware & firmware without ever acknowledging there were problems with the earlier units. That really pissed me off.

You can't tell what version you have just by looking at the outside. You have to open it up & look for the REV # on the circuit board. REV 4 boards have 5 chips: the custom ROM, a 1488/89 pair, an LS373, & a 556 dual timer. Not all brands of 1488's will work in them, either. Signetics 1488's worked best. Chips by TI, Motorola, or National acted flaky. Of course, the 15 feet of cable I had on there probably didn't help any....

I have to disagree with this. It seems that there is a *great*
opportunity here with an emulator to load 'cartridge images' into the
appropriate memory slot and make it read only. Unless there's
something I'm missing, I would guess that most games just checked to
see if they could rewrite themselves or not to see if they were in ROM
or RAM -- this will have to be done to preload the built-in BASIC of
the XL's, right? Why not have an optional 'cartridge image' load in
at execution time?

Of course, you're reading something from somee whose best effort to
download cartridges was to hold down the START key and load DOS from
a cassette... Back when you could disassemble an OS and read it in an
afternoon...

> Bill Kendrick writes neat stuff about expanded potentials for 8 bit
> emulators.

I've been thinking of things like this as well, and wonder how much of it would be worthwhile doing. I think it would be extremely neat to be able to write to the VGA card directly! At the minimum, provide an 80 column E: handler, and other similar support.

The only thing is, all these enhancements like more memory, 80 columns, mouse support, 65816, etc. -- things that would enhance 8 bit applications -- may have a lot less significance considering that the emulator is going to be running on a machine that already supports native applications well in advance of what's available for the Atari8. There's no question it would be really cool, but the development time is going to have to be justified somehow. I think a hardware card that supported carts, and an SIO port, would be a worthwhile device. I'm worried that most of the exotic stuff would be roadblocked by either development time, or by the lack of consumer willingness to support it.

>Essentially, the carts check to see if the cart is there. Don't think
>so Dave. The way I do disk loads of carts is with a cart copier that
>uses a dummy cart.

Actully if refuring to disk copy protection (If not I had to get it out
anyway) I found one very good way to fool about 50% of teh programs.
Do a sector by sector copy of a disk copering every single sectorer (not
using dos's sik duplacater) I found that it markes used secctores as
free there for fooling duplcation programs.

I wrote one little 5-10 liner basic program which read a byte wrote a
byte and workes wonderful copied printshop and many others that way.
Others which use other phisical tricks won't work liek AtariWriter +
which uses a double sector to check with.

I like your idea of a 'cartridge image', & also believe that most of the protection schemes tried to write to them selves. Maybe all of us that would like to see this happen, should mention this when you write the author about what you like, dislike & would like to see in the next version.

3449. Atari 8 bit emulator for AMIGA?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-29 12:51:06 UTC
From: moran@bnr.ca
Message-ID: <2urqnq$6os@bmerha64.bnr.ca>
Source record: 100227

I've seen mention of an 8 bit emulator for PCs but has anyone seen or heard of one for the AMIGA?

Given that the Amiga is basically a 16 bit Atari 800 it should be relatively easy to emulate the old 8 bit - even things like display lists and PM graphics etc have equivalents on the Amiga.

Even an A1200 with some fastRAM should be able to do a full speed emu of the old 8 bit, an 030 model at >25Mhz should give BETTER performance than the original.

I'd really love to be able to use my 8 bit again but I dont have desk space for my old 800XL/1050 and my Amiga.

Even better, how about someone doing a cross platform development system to let you program in C/Action/Assembler on the Amiga/PC/ST , then using something like SIO2PC to load and test the file on an Atari 8 bit or even better, with a multitasking emu , run the program under emulation on the host.

3450. 8bit down, 8bit emulator for st?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-29 12:58:19 UTC
From: ewfox@Deakin.Edu.Au
Message-ID: <2urr5b$dd2@sol.ccs.deakin.edu.au>
Source record: 100228

My 600xl (64k internal) refusus to acknowledge my disk drive. It will only load tape. My other 600xl is only 16k. it acknowledges the DD but won't load over 16k. I don't think it's worth fixing...
So, does anyone know of an 8bit emulator for the 1040 stfm? I miss all my old games.
Remember Bounty Bob Strikes Back? Montyzuma's revenge? I have a lot of pre-release versions from working in a computer shop, inculding star-raiders 2 (last starfighter) which i have completed.
In a Sentimental Mood...
I also completed Shamus 2. goto to level 33 on Fractalus. Got bugged out by Koronis Rift. Almost completed the other Lucasfilm time machine game (whatever that was called) Loved the music on ballblazer. Hated BC's quest for tyres.
Liked Bruce Lee, Super Cobra, Gateway to Apshai, Ultima 2, Dropzone...
Anyone intetrested in posting their top ten games?
regards.

Half naked and half sedated, jharris@cup.portal.com ran through the streets
screaming something about "Re: [--- SPARTADOS ---] (...."

J>Sparta batch files are not able to pass parameters from the
J>command into the batch file itself. So you can't enter a filename after
J>the batch command. Ideally, this will be addressed some time in the future
J>as well.

This is because SD3.2 doesn't support environment variables like SDX
does, which is what allows parameter passing.

Adding that capability to 3.2 would be radical surgery. Personally, I
wish FTE would release a hard-disk-installable version of SpartaDOS 4.2
and let 3.2 die.

: : You've got to wonder some things though, did he ever see really how far his
: : design has gone thanks to awesome programming like Jeff Potter and others do!?

: I've got a rather sad story related to that. Jay did an online
: conference on Delphi in 1991 I believe regarding the Amiga 3000 I think.
: This was when he was still more involved with C=. I found a transcript
: of this conference in late mid to late '92 when I was on Delphi and there
: was actually some questions regarding the Atari 8-bit.

: Someone mentioned something about Action!, like whether Jay had ever
: programmed in it, and Jay said he had never heard of Action!. Action was
: released in 1983! So from this you can determine that after he had
: completed the Atari 400/800 GTIA he disassociated himself from Atari.

: In my tenure as a Carina sysop I was naturally close to David Hunt. Now,
: either the guy is a schizophrenic lunatic, or he was indeed, as he says,
: part of the Atari design team in the '70s. He said he worked side by
: side with Jay. Now, we all create cults of personality, but according to
: David, Jay was not the easiest person to deal with.

: He said that Jay really lost interest in the machine after he finished
: with it (I can't comment on Jay's Amiga years, they are different because
: the Amiga was being revised and the Atari never really did get revised
: graphically).

Glenn, I've been calling Jay Miner's BBS for many months, and have a
different perspective of the man, and an explanation as to his later
ties with Atari. Here's the beginning of an interview done with Jay at
the '92 World of Commodore-Amiga show in Pasadena, California:

----------begin----------

Jay Miner Interview Pasadena, September 1992.

The name badge says it all, Jay Miner, VIP, Father of the Amiga. During my
recent jaunt to the A4000 launch in Los Angeles, I was lucky enough to meet
and talk to Jay as he cast his fatherly eye over the next generation of the
architecture he created all those years ago. We talked and ate as he
reiterated the fascinating history of the secret project that resulted in
the birth of a remarkable machine, which has survived mainly because of his
foresight and supreme effort. It was all far from plain sailing, however,
and plenty of skullduggery was afoot from a number of parties, not least
the design team themselves!

The story about the Amiga's genesis has been told before, but it is only relatively recently that Jay and Commodore have been seeing eye to eye about the machine and its evolution. Also, there are many little anecdotes untold before now...

Jay:

"The story starts in the early 1980's with a company not originally called Amiga, but Hi Toro, which was started by Dave Morris, our president, but before all that I used to work with Atari and I wanted to do a 68000 machine with them. We had just finished the Atari 800 box and they were not about to spend another umpteen dollars on research for a 16-bit machine and the processor chip itself cost $100 apiece. RAM was also real expensive and you need twice as much. They couldn't see the writing on the wall and they just said "No", so I quit!".

[... the rest about the development of the Amiga...]

----------end----------

: Then I got info that he had a BBS but I never got the number. If he
: actually answered feedback maybe I could have piqued his interest since
: he was out of the Atari loop for 11 years.

I'm *really* disappointed you would put it in such a way. The man ran his board personably. He even advertised the fact that he loved to chat with the users and noted the times he was available to do so in his log-on screen. Here's the number, the BBS is still in operation through remote operation by his CoSysop.

"The Mission BBS" (415) 967-2021 V32/24 hours.

Personally, I did leave him mail in the regular message areas, introducing myself as a long time fan starting with the Atari 8 bit. And yes, Jay Miner gracefully replied to a comment that I was thinking about creating a .sig about my corny pun of my computers performing in the key of Jay Miner.

The last message I read from Jay was about a month ago when he replied to someone's question about his opinion of Commodore's bankruptcy. He, like all of Commodore's engineers and other-than-management personel, commented it was Commodore's mismanagement nand bad marketing. You'll find that many Amiga-oriented columnists and users who met him at frequent user-group meetings hold the opinion that Jay Miner was an extremely giving type of person. I'm not saying this as some "Amigoid" follower, but stating these things from the comments made by people like Peg Herrington.

I got the number to his BBS here on Usenet, BTW. You probably could have done the same. Also, the article I got the quote from above was from a text file I downloaded from his board: amigahistory.lzh (11338 bytes).

: After what I heard about his personality from David, I just didn't have
: the desire to fight and fight to possibly get bitched at for invading
: Jay's privacy.

Now why would he even run a BBS if he was in fear of his privacy being invaded?

I don't mean to come off as flaming your comments, but I've found Jay Miner to be at least (pardon the expression) "user friendly."

-Joe

3454. Top Ten 8bit Games was:8bit down

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-29 15:19:51 UTC
From: moran@bnr.ca
Message-ID: <2us3en$bss@bmerha64.bnr.ca>
Source record: 100230

my top 10 Atari 8bit games.....

(1) Alternate Reality 2 : The Dungeon
(2) Ultima IV : The Avatar
(3) Koronis Rift
(4) Rescue on Fractalus
(5) BallBlazer
(6) DropZone
(7) Schreckenstein (an obscure German game, pd maybe???)
(8) Shadow World (excellent in 2 player)
(9) Bounty Bob Strikes Back
(10) Defender ARCADE PERFECT!!!!!

Come to think of it, most of these games compare extremely
well with most of todays PC/Amiga software.

Gavan.

Source record: 100231

Kevin Atkinson (kevina@clark.net) wrote:
: Hello you all I have several questions about SprtaDOS and Sio2PC. Is it
: possable to get sparta dos to support teh large disk partions that Sio2PC
: can make. I would like to create a 5-10 mb partion and move all my files
: to it. On that matter does SpartaDOS 2.3 support a HD in general without
: specal tretment.

: Also what is teh SpartaDos Construction Set?

I can't answer all of the questions but I can tell you that SpartaDOS 3.2g supports harddrive (HDINIT.COM program formats them), and it will probably support up to the designed limits, which I think is either 8 or 16 megs per partition. And as far as I can tell the SpartaDOS Construction Set is SpartaDOS, I guess it is called Construction Set because it include technical information about SpartaDOS for programmers.

You can write mail to (I believe this is correct) ftemail@delphi.com, he should be able to answer all of the questions, but it seems that jharris@cup.portal.com is the one who is actually programming SpartaDOS for FTe. (Anyone know if this is correct?)

>Mow anyone know how to get software over?

Well, the readme.doc (or whatever it's called) talks about two ways:
the first is to constuct a cable ("SIO2PC") which allows you to connect
your PC to an Atari 8-bit machine. (The readme file, btw, is called
"XF2.DOC").

THe other way, a bit of a pain but how I would do it since my only
access is to a PC at work, is to send the files from the 8-bit to a
PC via modem (of course, you need two modems and two phone lines).

There IS an Atari 8bit emulator (being worked on) for Amiga. I forget the name of it, or wait, I THINK it's called "Emplant". It's hardware partially though I believe. So far it DOES do Mac. Last I heard (read a little in an Amiga magazine.. advert) it's status was:

Working:
Mac

Testing:
Atari 8bit
Apple II

To be made:
IBM
Commodore 64

SOmeone correct me if I'm wrong.

Uh, I don't think so. A friend of mine, who is quite good at 68030 assembler, wrote a 6502 emulator for his 16 MHz Falcon030 (before he sold it due to lack of support). The best he could do was about 2/3-3/4 speed of the 1.79 MHz 6502 in the Atari 8-bit.

Meanwhile, my Cyrix-based 486DLC 40 MHz machine manages to run XF2 about twice the speed of an 8-bit, which is kinda cool, but I use the standard speed mode most of the time.

While I'll admit that an Amiga 1200 with Fast RAM is probably faster than a Falcon030 (I owned an A1200 for a year, and sold it like a damn fool), it won't do the job. I think you'd need at least a 25 MHz A3000 or even an A4000 to get full speed emulation. Then you have to write the code to emulate the 8-bit's custom chips.

I can't think of anyone who would rather use an 8-bit application or term program instead of a native 16/32 bit one if they had to choose. There are ATASCII terms for the IBM and others. It's a catch-22. Those who have IBMs really aren't going to be the ones interested in running the exotic enhanced stuff in 8-bit emulation. If they do it would only be a curiosity. This emulator is mostly just for games and demos and stuff. As much as I love the Atari, if I spend $1000+ on a 32 bit machine by golly I'll get some use out of it and won't use the Atari 8-bit exclusively.

: different perspective of the man, and an explanation as to his later
: ties with Atari. Here's the beginning of an interview done with Jay at
: the '92 World of Commodore-Amiga show in Pasadena, California:

Well, your post was very Amigo-centric. How much he would have been willing to discuss the Atari will remain an unknown. I can only say that I was not served well by the head of the Amiga area on Delphi. He gave me the impression that Jay was not interested in talking about computers and that he did NOT run a BBS (circa 1992).

I've been known to be very gullible and this is probably a matter of that character trait burning me again in so far as taking someone's person as gospel. In the case of David Hunt, he may just have sour grapes over Jay's disinterest in the 8-bit. I'll have to call Ace of America and give David the news and see what he says. Unfortunately the Carina network has deteriorated to the point where only about 5% of the posts in the Atari 8-bit sig are substantive, the rest are invovling the ongoing flame wars between Terry Ortman and his many estranged 8-bitting peers.

I wish I had that Delphi interview though, because I swear to God it came across as though Jay didn't know or care what the heck the Atari was up to beyond 1980. If that is the case then even had he been polite to my request for info, he would probably have been personally disinterested in the Atari and although it would have been good to get specific anecdotes about designing ANTIC/GTIA I'd probably be turned off by his current attitude. I mean, anyone who is disinterested in what they USED to be involved in usually is of a mind of "it's old tech and it is dead" and that is attitude which I really despise having to deal with. Of course, it would not be uncommon for a hardware designer to have a "state of the art is best" philosophy.

I believe it was Bill Wilkinson in the preface of Mapping the Atari that said some quip like "having to poke two values sequentially to do a double poke is one of the main disadvantages of the 6502". In comparison to the 16-bit internal 65802 being able to write to addresses over 256 in one operation. If I'm reading a tutorial about a platform I don't want the guru to rip the archetecture.

The programmer of either Kermit65 or Omnicom (I think it was Kermit65) went on a similar quip with "this replaces the otherwise WORTHLESS ATASCII graphics characters". In other words, his attitude being that the Atari's uniqueness is not to be valued, but that the Atari should have had plain old ASCII so it would "fit in" with the machines which he

uses on an everyday basis. To him, it probably would have been better if the Atari also used a Z80 instead of a 6502 (to be more IBM/CP/M ish).

It was the same thing with the guy who composed "hollywood medieval". In the text file he snobbishly talks about how he pushed Pokey and can't wait to get his hands on newer better technology.

If these people didn't like the Atari they shouldn't have gotten one, let alone programmed for it.

The Atari has been blessed (or cursed depending on how you look at it) with people who at one time were totally immersed into the Atari but when they saw something new come along they were gone before you could say Shazam and left all their loyalties just as quickly.

I classify Kieth Ledbetter, Clayton Walnum, "Mat Rat", and a bunch of others in that category. As much as these people could be considered "8-bit guru's", trying to talk to them now is not a good idea because their overall snickering attitude over the current remaining userbase will be counter to the purpose of talking with them.

I mean, _I_ may find myself in that despised category eventually. But it is important for people like that to respect the machine they once loved and those who are still devoted to it, even though to THEM, it didn't make sense to stick with it.

Even Atari has been disrepectful of its past. Just recently Star Raiders 2000, the closest move to connect between Old and New Atari, has been changed to a 3-D Space War project. It is uncertain whether a 1-player vs. Zylon scenario will even be included! If they don't do a good job on SR2K I'll be VERY pissed off because I was willing to forget all of the Tramiels' sins and get a Jag because of the unspoken respect Atari shows to its roots with SR2K.

>
Thanks for posting this Glenn. I just compiled this on my HP 9000/720,
and asked it to compute 10000 digits for me, and it core dumped. A little
debugging revealed that the array "long stor[21]" is too short. Bumping it
to "long stor[100]" fixed the problem for 10000 digits, and will probably
work for much larger numbers, but the real answer is to dynamically resize the
array with realloc(2), since the maximum size needed appears at first glance
to be indeterminate. I have recoded it to dynamically allocate this array,
and can mail the source to anyone who asks for it.

OK, so I drifted off topic a bit. I just thought I'd save somebody else from
debugging this code.

3468. Re: Atari 8 bit emulator for AMIGA?

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-30 00:15:40 UTC
From: krishna@max.tiac.net
Message-ID: <2ut2rc$2mv@sundog.tiac.net>
Source record: 100245

Gavan Moran (moran@bnr.ca) wrote:
: I've seen mention of an 8 bit emulator for PCs but has anyone seen or heard of one for the AMIGA?

: Given that the Amiga is basically a 16 bit Atari 800 it should be relatively easy to emulate the old 8 bit - even things like display lists and PM graphics etc have equivalents on the Amiga.

: Even an A1200 with some fastRAM should be able to do a full speed emu of the old 8 bit,
: an 030 model at >25Mhz should give BETTER performance than the original.

: I'd really love to be able to use my 8 bit again but I dont have desk space for
: my old 800XL/1050 and my Amiga.

I thought that the Amiga could probably do a good emulation with less CPU power than most emulators for the same reasons, but John Harris says that although there are analogous graphics functions, the main lag is in emulating the CPU. True, the 6502 and the 68K series have the same "endian" system and thus you don't have to flip things around like you have to with a 68K emulating an 8080,Z80,8088,x86 processor in software, but you still have to do the rest of the CPU emulation.

After that is taken care of, I'm sure the Amiga could handle PMGs and all that a lot easier than PC XFormer can.

However, the Amiga lacks one thing that the Atari has: true text modes.

John tells me the slower older Amigas can't really push text at speeds that even the Atari can (with custom routines like Bobterm and FlickerTerm). Kinda proves how important text modes can be!

Therefore games which use character set animation might lag in an Amiga emulation unless on a very fast machine.

We shall see. Jim Drew is one of THE most important remaining Amiga developers (almost the Bob Puff of the Amiga world). He is in a tough situation in which he canlook at the glass as half empty or half full. On the one hand no doubt more Amigoids than ever will want to emulate other platforms, but on the other hand many might just CHUCK the Amiga and physically leave, especially since RISC technology is on the horizon and people are talking about eventually running the Amiga itself as an emulation on a fast RISC box.

Therefore I can't tell whether Jim will eventually follow through on his promises for the wide variety of platforms to be emulated. Time is not on his side I'm afraid. He may or may not do Emplant 1200. Personally I doubt it, though he may have made a statement on it, I dunno.

He told me that not only will the Atari 800 be supported but also XL/XE
eventually (but so does Darek and his isn't done either).

I've been careful to only pull out old 800 games or limited graphics/no collision stuff. I'm really waiting for the release of the 800XL version.

To transfer things from Atari to IBM by disk, use either SR.ARC to read SpartaDos formats, or the MyDos version (can't remember the name off the top of my head). SR.ARC and the MyDos program are both available from GEnie in the Atari 8-bit software libraries. Likely available other places also. I converted all my 8-bit databases to proper IBM formats using TextPro 4.5 macros, then SR.EXE to read them onto IBM. Never a problem once I figured out the program.

3470. atari 8bit stuff for sale!!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-30 01:43:12 UTC
From: anbrown@husc9.harvard.edu
Message-ID: <2ut7vg$5tn@scunix2.harvard.edu>
Source record: 100247

I need to get rid of all of my Atari 8 bit stuff to pay off some bills.
I would be willing to get rid of it all for $300.00 Plus shipping

I have too much to list, and I can't remember it all, but there is lots
more than this...

Everything has all the cables and power supplies and is in vary good shape.

Here goes:
Atari 800xl 256k
Atari 800 48k
3 1050's (2 double density, 1 dual)
1 percomm single density data drive
850 interface with modem and printer cables
1200 baud hayes compatible modem(easy data brand)
koala Pad w/ MicroIllustrator
suncom animation station touch tablet and software
supra microprint interface
apeface printer interface

lots of cartridges, mostly games at least 6 game cartridges
assembler editor cartridge w/manual
mac 65 assembler editor, never been used, still in box
action language cartridge w/ manual

spartados 3.2 construction set
tons of analog and antic back issues, some with disks, most w/o

LOTS of games, mostly commercial, including alternate reality the dungeon..
too many to list, because I cannot remember them all..

Also, If you want, for an additional $50 I can include my panasonic kxp1180
printer and paper bought it new, and only used it for about a year, I
still have the original box and styrofoam, with a new ribbon in the
printer, and an extra ribbon...

I don't want to split up the system. Any reasonable offer will be
accepted also. I am selling off my stuff because I owe that greedy
uncle sam some more money in taxes(Why Bill, Why!)

anyhow, you can email me directly at anbrown@husc.harvard.edu or directly
to this newsgroup

From: KENDRICK@sonoma.edu
Message-ID: <940629192049.2340cc30@sonoma.edu>
Source record: 100250

Ok, I guess this is because IBMs are 'fast', but I want to know exaclty how XF2 gets about emulating ANTIC/GTIA !?!?! I mean, it's not exactly one or two static bitmapped VGA screens that must be dealt with! This is dynamic, on the fly (during VBI, DLI's etc!) graphics manipulation! How the hell does XF2 do this and still even RUN on a 286!?

Also, what's so hard about emulating 800xl that makes all of these emulators do only 800 (for the moment) !?!? The only diffs. >I< know of are XL OS's are a bit more efficient, can swap out of memory, and have self-test ;)

(I think I should read over the XF2 docs, I've got so many questions nowadays, but I bet half of them are already answered ;) .. like about carts, turning off basic, loading ATRs, etc ;))

Date: 1994-06-30 05:00:22 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01HE4U1VXB2Q8WYFU6@vax.edinboro.edu>
Source record: 100156

I was wondering if anyone knows how to simply modify the Atari Touch Tablet so it works like a Koala Pad? I seem to remember that this was a very simple task, but I can't remember what to do.

Thanks for any help.

3478. XF551 EXTRAVAGANZA

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-30 05:14:34 UTC
From: b.poehland@genie.geis.com
Message-ID: <199406300514.AA191243253@relay2.geis.com>
Source record: 100157

To Nathan Centofanti & Jerry Dunham,

Thanks for responding to my XF551 ad. I sent individual responses to you guys but they bounced. To Jerry especially, I sent a long message & was much distressed to see it come back.

Anyway, guys, I only had 4 to sell & was swamped almost immediately with responses. You fellows were #6 & #7, respectively. The only one not spoken for is the junker. Still available, $25.

Chad, you were #5. I'll try to contact you if one of the other folks poops out on the deal. I answered 7 inquiries total, of the 4 who were first in line 2 haven't gotten back to me with commitments. They have till July 12.

Apologies for the mad scramble & garbled message. I wasn't expecting such a rush.

- Ben Poehland

3479. STATUS OF AC REFUNDS

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-30 05:16:34 UTC
From: b.poehland@genie.geis.com
Message-ID: <199406300516.AA194583373@relay2.geis.com>
Source record: 100158

I'd like to give an update on AC refunds. I've been working very diligently on this for the past month, some checks have already gone out & the overall process is about 50% completed.

About 350 people qualified for refunds under the policy explained in the April 1994 issue of AC. These broke down roughly as follows:

300 American
15 Canadian
35 Overseas

Of the 300 American refunds, 100 have already been delivered or are presently in the mail, & the remaining 200 have been calculated & are in the hands of Unicorn Publications, whenever they feel like writing checks & sending them to me. I believe the 100 already sent out brought us into the high "H's" (they're going alphabetically by last name).

The 50 Canadian/overseas refunds were calculated & are presently en route to Unicorn.

From this point forward the speed of the refund process will pretty much be controlled from Ann Arbor. I have several hundred empty envelopes here, all stuffed/stamped/labelled & ready to go, once Unicorn sends me the checks. The checks typically go out an average of 48 hours after I've received them. (I actually "stagger" the mailings to avoid swamping my local post office.)

Mike Hohman of FTE mentioned to me he thought Jim Hood might be planning a July issue. I haven't been able to confirm that.

Back issues of AC (disk or mag) are still available from me for $5/item, though I'm not sure for how much longer. Things are rapidly winding down at my end here. Anyone wishing to buy back issues should send cash/check/MO to:
BEN POEHLAND
179 Sproul Road/Rt. 352
Frazer, PA 19355

All 8 issues of the magazine (Dec '92 thru Apr '94) are still available except for Feb '93 which is sold out. Unicorn sent me batch of the special December '93 Video Issue they found lying in their office, so my supply of those is replenished. The 4 Software Disks are also still available (also $5 each).

Anyone wishing to subscribe to future issues of AC should write to:

JIM HOOD
5507 Langford Court
Concord, CA 94521.

I'll post one final message when all the refunds have been completed & sent out (whenever that happens!).

POKEing 755 does work.

I was a bit surprised to see the PC go into attract mode after a while, but I don't know why this surprised me, it was obvious 8^)

I did type in one program which did a bit of fancy work with DLIs and m/c to put several blocks of colour on screen with the 'rainbow' effect operating in different directions, and it did not work correctly, so perhaps the timing is not exactly right yet. It did use NOPs for some tight timing, so it was pushing it a bit. The program was from an old Page 6. If anyone is interested I'll try to post it as it's hard to describe the effect.

Geoff

... Any resemblance between the above views and those of my employer, my terminal, or the view out my window are purely coincidental. Any resemblance between the above and my own views is non-deterministic. The question of the existence of views in the absence of anyone to hold them is left as an exercise for the reader. The question of the existence of the reader is left as an exercise for the second god coefficient. (A discussion of non-orthogonal, non-integral polytheism is beyond the scope of this article.)

Atari 8-Bit Computers

Frequently Asked Questions List

Revised 23-Jun-94

Additions/suggestions/comments/corrections having to do with this
FAQ List are requested. Please send to:

Michael Current
mailto::mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

TABLE OF CONTENTS:
Introduction
1.1) What is this 8-bit Atari FAQ List?
1.2) What is an Atari 8-bit computer?

Usenet
2.1) What is comp.sys.atari.8bit?
2.2) What other newsgroups are of interest to 8-bit Atari users?

E-Mail
3.1) What is the Info-Atari8 Digest?
3.2) What is INFO-A8?
3.3) How can I access the Atari Archive by e-mail?
3.4) How can I retrieve files from FTP sites by e-mail?

FTP
4.1) How can I access the Atari Archive by FTP?
4.2) What is the Boston Archive?
4.3) What is the PVV Archive?

Telnet
5.1) What is the Cleveland Free-Net Atari SIG?
5.2) What is the Youngstown Free-Net Atari SIG?
5.3) What is the National Capital Free-Net Atari SIG?

Gopher
6.1) How can I retrieve files from the Atari Archive through Gopher?
```

World-Wide Web
7.1) What is the Atari Classic Homepage?
7.2) What is the Atari 8-Bit Home Page?
7.3) What is the Atari 8-Bit Resort?

Prospero
7.5) How can I access the Atari Archive by AFS?

Publications
8.1) What print magazines support the 8-bit Atari?
8.2) What disk magazines support the 8-bit Atari?

File Formats
9.1) What's this UUEncoding stuff (.uu, .uue files) all about?
9.2) What is an .arc file?
9.3) Okay, how about a .dcm file?

Emulation
10.1) What 8-bit Atari emulators exist for other computing platforms?

File Transfer Solutions
11.1) What are the best telecommunications programs available?
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?
11.3) Can I read/write DOS disks on an 8-bit Atari?
11.4) How do I transfer files using a null modem cable?

Storage Media
12.1) What 5.25" floppy disk drives are available?
12.2) How can I use 3.5" floppy disks with my 8-bit Atari?
12.3) What do I need to connect a hard drive to my 8-bit Atari?
12.4) How can I use an IBM-PC as a storage device for my Atari?

General Interest
13.1) What's the best DOS for the Atari?
13.2) What hardware has Atari created in the 8-bit computer line?
13.3) What are the pinouts for the...?
[to add: M.U.L.E./Mule, power supply requirements]

Other Documents of Interest
14.1) What product developers or vendors support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?

==========
1.1) What is this 8-bit Atari FAQ List?

The Atari 8-Bit Computers FAQ List was created to provide answers to many commonly asked questions found in news:comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8. It is in a constant state of development.

Much of this FAQ List is geared toward providing information on the various Internet resources available for 8-bit Atari users.

Where to get the latest copy of this FAQ List:
ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers
mailto::mcurrent@carleton.edu
and many other places that archive Usenet FAQ Lists.

This FAQ List is automatically posted to news:comp.sys.atari.8bit, the Info-Atari8 Digest, INFO-A8, news:comp.answers, and news:news.answers, every 30 days.

==========
1.2) What is an Atari 8-bit computer?

To be written. Volunteers, anyone?

==========
2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet side of this discussion group. All postings to news:comp.sys.atari.8bit automatically appear in the Internet's Info-Atari8 Digest and in BITNET's INFO-A8.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on news:comp.sys.atari.8bit.

[I'd like to include the charter for news:comp.sys.atari.8bit here. Anyone know where to get it?]

==========
2.2) What other newsgroups are of interest to 8-bit Atari users?

news:comp.emulators.misc (includes emulation of the 8-bit Atari)
news:comp.sys.atari.advocacy (includes 8-bit Atari advocacy)
news:comp.sys.atari.announce (includes announcements for 8-bit Atari users)

==========
3.1) What is the Info-Atari8 Digest?

If you do not have Usenet access, but you do have Internet e-mail access, you can access this discussion group through the Info-Atari8 Digest.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send a free-text request to mailto::info-atari8-request@naucse.cse.nau.edu.

To CONTRIBUTE to the Info-Atari8 Digest, send your posting to mailto::comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in BITNET's INFO-A8.

Note that any posting sent to mailto::info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. The maintainers are presently working to correct this.

The Info-Atari8 Digest maintainers (not moderators) are:
Mike Jewison, mailto::mjewison@nereid.sal.ists.ca

Mike Todd, mailto::snyder10@convex1.TCS.Tulane.EDU

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

==
3.2) What is INFO-A8?

If you do not have Usenet access, but you are on BITNET, you can access this group through the INFO-A8 listserv.

The BITNET subscription commands are:

tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

This is not a standard BITNET mailing list. It is a distribution of the Internet's Info-Atari8 Digest. In order to send mail to all of the subscribers, both in BITNET and the other networks you should not send your mail to the BITNET address (INFO-A8@MARIST) but instead send to the Internet address: mailto::comp-sys-atari-8bit@cs.utexas.edu.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST. Please note that this command must NOT be sent to the BITNET list address INFO-A8@MARIST or to mailto::comp-sys-atari-8bit@cs.utexas.edu, but to the LISTSERV address LISTSERV@MARIST.

Contributions sent to this list are automatically archived. You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST. These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Please note that it is presently possible for anybody to determine that you are signed up to the list through the use of the "REVIEW" command, which returns the network address and name of all the subscribers. If you do not wish your name to be available to others in this fashion, just issue a "SET INFO-A8 CONCEAL" command to LISTSERV@MARIST. More information on LISTSERV commands can be found in the "General Introduction guide", which you can retrieve by sending an "INFO GENINTRO" command to LISTSERV@MARIST.

The INFO-A8 maintainers (not moderators) are:
HARRY@MARIST (A Harry Williams)
mailto::RAVI@SPEEDY.MCNC.ORG (Ravi Subrahmanyan)
mailto::RAVI@MCNC.ORG (Ravi Subrahmanyan)
mailto::BILLW@SCORE.STANFORD.EDU (Bill Westfield)

INFO-A8 was created on December 9, 1986.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in INFO-A8.

==========
3.3) How can I access the Atari Archive by e-mail?

Downloading

BART - Brode's Archive Retrieval Thang - the Atari Archive e-mail file server

To learn about using BART to access the Atari Archive, send e-mail to:
mailto::atari@atari.archive.umich.edu. The subject of the message doesn't
matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to mailto::lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

==========
3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto::ftpmail@decwrl.dec.com with no subject line, and two-line
body with line one help and line 2 quit

2) mailto::ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto::bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto::BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

==========
4.1) How can I access the Atari Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto::lenn@atari.archive.umich.edu; the Atari Archive as a whole is

maintained by Mickey Boyd, mailto::boydm@atari.archive.umich.edu. The
best way to contact the Atari Archivists is
mailto::atari-archivists@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your
user name, and your e-mail address as your password. All of the
following FTP sites follow this convention.

Downloading

(Try the site nearest you first)

a) ftp://atari.archive.umich.edu/atari/8bit
(141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/mirrors/archive.umich.edu/atari/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, Great Britain)

The following Australian FTP site apparently no longer mirrors the
Atari Archive:
d) ftp://archie.au/alex/edu/umich/archive/atari/atari/8bit
(139.130.4.6, Australia)

e)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

f) ftp://nic.switch.ch/mirror/atari/8bit
(130.59.1.40, Switzerland)

g) ftp://mirror.archive.umich.edu/
This address takes you to a "randomly chosen" University of Michigan/Merit
Software Archives mirror site, but there's no guarantee the site you're taken
to mirrors the Atari directories.

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in:
ftp://atari.archive.umich.edu/atari/8bit/New
(141.211.120.11, United States)

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

==========
4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston
University. It is maintained by Adam Bryant, mailto::adb@albert.bu.edu.

ftp://cs.bu.edu/PC/ATARI (128.197.2.2, United States)
(user name "anonymous"; password is your e-mail address)

==========
4.3) What is the PVV Archive?

This is an Atari FTP site maintained by Eyvind Bernhardsen,
mailto::eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/atari/8bit (129.241.36.207)
(user name "anonymous"; password is your e-mail address)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

==========
5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is like a huge public bulletin board system,
and it is the hub system of the NPTN, the National Public Telecomputing
Network. Anyone can access the Cleveland Free-Net via modem at (216)
368-3888. Those persons with full Internet access can TELNET (this does
not mean FTP) to telnet://freenet-in-a.cwru.edu,
telnet://freenet-in-b.cwru.edu, or telnet://freenet-in-c.cwru.edu
(129.22.8.32, 129.22.8.51). Applications for free accounts are handled
online, or you may browse the system as a visitor. Once logged-in, type
"go atari" to reach the Atari SIG. Those who add their names to the Atari
SIG user directories are automatically members of the official Atari user
group C.A.I.N. - Central Atari Information Network. Send correspondence
and press releases to mailto::xx004@cleveland.freenet.edu. The Atari SIG's
8-Bit Computers Support Area is maintained by Michael Current,
mailto::aa700@cleveland.freenet.edu, the 8-Bit Technical Forum is
maintained by Craig Lisowski, mailto::aa853@cleveland.freenet.edu, and the
Atari SIG Manager is Len Stys, mailto::aa399@cleveland.freenet.edu.

==========
5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://yfn.ysu.edu or 192.55.234.27
Via Modem: 216/742-3072
Login: visitor

Youngstown Free-Net Atari SIGOps:

Joe Perkins (mailto::ac742@yfn.ysu.edu)
Joe Sabatino (mailto::ab588@yfn.ysu.edu)

Atari SIG (mailto::xx140@yfn.ysu.edu)

==========
5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://freenet.carleton.ca or 134.117.1.25
Via Modem: 613/780-3733
Login: guest

National Capital Free-Net Atari SIGOp:

Christopher Browne (mailto::aa454@Freenet.carleton.ca)

==========
6.1) How can I retrieve files from the Atari Archive through Gopher?

The Atari Archive can be accessed in Gopher. Try
gopher://gopher.archive.merit.edu:7055/11/atari/8bit to connect directly
to the Atari Archive's 8-bit directory. I personally recommend this
method for downloading from the Atari Archive.

You can also use gopher://src.doc.ic.ac.uk

or possibly gopher://wuarchive.wustl.edu

==========
7.1) What is the Atari Classic Homepage?

Maintained by Eyvind Bernhardsen, mailto::eyvind@pvv.unit.no. Point your
Web client to:

http://www.pvv.unit.no/~eyvind/atari/

==========
7.2) What is the Atari 8-Bit Home Page?

Run by mailto::ipoorten@cs.vu.nl (Ivo van Poorten). The URL is:

http://www.cs.vu.nl/~ipoorten/8bit.html

==========
7.3) What is the Atari 8-Bit Resort?

This one is kept by mailto::un55@rz.uni-karlsruhe.de, Marek Tomczyk. URL:

http://rzstud1.rz.uni-karlsruhe.de/~un55/8bit.html

==========
7.5) How can I access the Atari Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

==========

==
9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
ftp://atari.archive.umich.edu/atari/8bit/Archivers/uudecode.bas
just ENTER this into Atari BASIC
ftp://atari.archive.umich.edu/atari/8bit/Archivers/uudecode.doc
the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
ftp://atari.archive.umich.edu/atari/8bit/Archivers/yau.arc - contains both
yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
ftp://atari.archive.umich.edu/atari/8bit/Utilities/uue.arc - contains
uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
ftp://atari.archive.umich.edu/atari/8bit/Cc65/dumasuu.arc - contains
uud.com, uue.com, CC65 sources.

==
9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
ftp://atari.archive.umich.edu/atari/8bit/Archivers/superarc.arc - both
Super Un-Arc and Super Arc
ftp://atari.archive.umich.edu/atari/8bit/Archivers/suprarc2.arc - just
Super Arc
ftp://atari.archive.umich.edu/atari/8bit/Archivers/supunarc.com - an
un-arc'd copy of Super Un-Arc
ftp://atari.archive.umich.edu/atari/8bit/Archivers/supunarc.uue -
uuencoded copy of supunarc.com

==
9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
ftp://atari.archive.umich.edu/atari/8bit/dskcom32.arc
ftp://atari.archive.umich.edu/atari/8bit/Archivers/diskcomm.arc

==========
10.1) What 8-bit Atari emulators exist for other computing platforms?

1) ST Xformer, from Branch Always (see companion vendor/developer list)
a freeware 8-bit Atari emulator for the Atari ST.
[how about a URL!]

2) PC Xformer 2.0, from Branch Always (see companion vendor/developer list)
a freeware 8-bit Atari emulator for DOS/Windows/OS/2
[how about a URL!]

3) "The German PD emulator for DOS"

Don't expect much from this program, it isn't done yet. URL:

ftp://atari.archive.umich.edu/atari/8bit/Misc/at800xl.zip

4) "The 8-bit Atari emulator for X/Windows"

Nearing release, from Frank E. Barrus, mailto::feb6399@ultb.isc.rit.edu

==========
11.1) What are the best telecommunications programs available?

Here are some of the more popular PD/shareware terminal programs
available on the Atari Archive:

BobTerm, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/bterm12.arc

Kermit-65, public domain by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:

==========
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs on the atari.archive of this variety. Note
that these require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - Try this one first! URLs:
ftp://nova.pvv.unit.no/pub/atari/8bit/utilities/disk/myutil.readme
ftp://nova.pvv.unit.no/pub/atari/8bit/utilities/disk/myutil.zip

==========
11.3) Can I read/write DOS disks on an 8-bit Atari?

If your highest-capacity floppy drive on your Atari system is the
Atari 1050, you won't be able to use ATARIO, SpartaRead, or UTIL. You
still have the following alternative:

Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/mule.arc - includes
Atari Mule; Action!, Turbo C sources
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/mule.exe - IBM Mule
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/mule.txt -
descriptive blurb

==========
11.4) How do I transfer files using a null modem cable?

This section by mailto::cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be
connected. Just cross the transmit and receive lines

and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

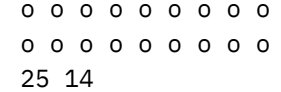
A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.



(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator

6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

==========
12.3) What do I need to connect a hard drive to my 8-bit Atari?

original my mailto::Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
ICD Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 14.4K baud
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==========
12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto::d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC is a shareware product from Nick Kennedy, whose contact information may be found in the companion vendor/developer list.

[Atari Archive filename(s) should be placed here!]

==========
13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the Atari Archive. URLs:
[URLs here!]

==========
13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS
800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)

822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7-pin dot matrix, same as Commodore MPS-801)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as the XE's)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

I finally got ahold of the PC Xformer 2.0 emulator, but I'm having a problem with it. First off, I admit the problem may be the type of PC compatable I'm trying to run it under, but I have to say that this is the only program I haven't been able to run. Anyway, here's the deal...

I'm trying to run this puppy on an 8MHz '286 w/'287 math co, 1 meg RAM, DOS 5.0, ATi Wonder 512K SVGA card and a 32 meg MFM hard drive using SuperStor disk doubler. This is on an... IBM Bridgeboard in my Amiga. :-)

Hey, everything ELSE I've tried running (286 software, that is) runs fine.

Anyway, as soon as I run the XF2 executable, I get the blue screan and "Ready" prompt, but the letters "QQQQQ... etc." just keep being typed away, and no other key will react exept the shift-loc will put those "Q's" in lower case or the CTRL key will change the "Q" to the ATASCII symbol. My funtion keys won't do anything other than delay the ongoing "Q's" being printed on the screen.

I think the emulator must be working because I can try loading it with the DEMOS.XFD disk image and since this file doesn't have an actual DOS on it, the emulator loads up printing the BOOT ERROR message all down the screen.

I know... I suspect it's my Bridgeboard keyboard device, but I thought I'd post this just incase someone had an answer that didn't involve getting a real PC. Actually, I have better than that... I have a real Atari XL! :-)

-Joe

3486. Emulation of the Atari 8-bit hardware

Newsgroup: comp.sys.atari.8bit
Date: 1994-06-30 12:26:58 UTC
From: ipoorten@cs.vu.nl
Message-ID: <Cs7MKz.21K@cs.vu.nl>
Source record: 100164
Cross-posted to: comp.sys.atari.8bit,comp.emulators.mics

Hello,

Currently I'm into writing an Atari 800XL emulator in C which should consist of a highly portable emulator with a small system dependant back end (e.q. graphics and keyboard I/O). In the development stage, everything is compiled under SunOS Release 4.1.3 with cc, under MSDOS 5.0 with Turbo C 2.0 and under TOS 1.62 with Heat & Serve C or Turbo C 2.0.

Now I have a question. I know I have to emulate the ANTIC and the GTIA completely (graphics), but what parts of the POKEY and the PIA should I emulate? For example, do I need to emulate keyboard interrupts and disk IO interrupts? Also, do I need to emulate the serial transmission between the diskdrive and the computer? Or should it be enough to 'trap' all SIO (serial input output) calls with a small C routine performing the same action(s)? How is this done in other emulators (for example the Apple2 and C64 emulator(s)?

I hope somebody can help me out on this.
Thanks in advance,

Ivo van Poorten

You can alos use a null modem cable if the PC or in the same room. A lot
simpiler then the suggestion above. >>

Look at my first suggestion again.

<< About 4 years ago an Atari user by the name of Nick Kennedy tackled exactly
this problem. And he developed a cable called the SIO2PC cable, to directly
connect an Atari 8-bit computer to the PC.

Now of course he had no clue that 4 years later someone would come around and
write an emulator, so the reason for his cable was to use a PC with its big
PC hard disk to store Atari 8-bit files. Basically, using a PC as a very large
hard disk for an Atari 800. By daisy chaining both a PC as well as a real
Atari 8-bit disk drive onto the cable you are then able to copy files from
the 8-bit disk drive to the PC.

As it happens, guess how the SIO2PC software stores the 8-bit files on the PC
once they're transfered over the cable? In virtual disks of course! In fact,
virtual disks created by SIO2PC are almost identical to those created by
the ST Xformer cable, and so PC Xformer 2.0 supports both types of virtual
disk files. (The difference is an extra 16 byte header that SIO2PC uses).

The SIO2PC cable has been around for 4 years and is fairly well known in
the Atari 8-bit community, so this document will not describe how to build
or use the SIO2PC cable. Contact your local Atari dealer, your user group,
download files #5281 and #6414 from the Atari 8-bit roundtable on GEnie, or
best yet, contact Nick Kennedy directly at 501-967-3843 or write to him at:

Nick Kennedy
300 South Vancouver St.

Russellville, AR 72801

There is one other very common way to transfer a file between any two computers, and that is to use a null modem cable or two modems. Whenever you call a BBS with your modem and download a file, you are transfering a file from one computer (whether it be a PC or Mac or ST) to another.

There are thousands of public domain and shareware Atari 8-bit programs available for download from BBSs and online services. Download these files to your PC using whatever DOS or Windows based terminal software you normally used (that's most likely how you obtained this copy of PC Xformer 2.0)

>>

The above is extracted from the XF2.DOC file. That is where I got *both* my suggestions from. I agree, the null modem cable is simpler but since I cannot get my 800 and the PC at work in the same room, no choice for me :-(

Yes, try atari.archive.umich.edu /pub/Atari/8-bit

I downloaded a bunch of stuff from there and (Dog Daze, Shrink/Unshrink, etc.) and it works *beautifully*! Try this - format drive 2. Takes a second and you've got a blank virtual disk to work with!

(btw - before formatting "drive 2" you naturally have to run PC Xformer with a second drive attached - but beware, make sure that the virtual disk used for drive 2 is something you've made a duplicate of, since the formatted virtual disk will be saved... wish I had SmartDOS! :-)

Speaking of Atari 8-bit emulation...

I got to thinking this morning, and then to wondering: does SIO2PC emulate Atari diskettes at the SECTOR level, or at the TRACK level? If the latter, it would be trivial to emulate bad-sectored, fuzzy-sectored, and other "exotic" disk formats, therefore to create/replicate/operate with "protected" pseudo-floppies. It'd take a Bob Puff "Archiver"-equipped drive to grab the original protected diskettes at the track level to make the original pseudo-floppies, but once you'd done that, there'd be no need to further crack the duplicate...

Am I making any sense here?

Chris

I think what he was referring to was the images themself (of popular
software)

Doing it the way you said would take a loooong time to do unless you
only wanted one file.
You would have transfer over a file at a time. I would much rather
download the disk images filled with 30 or so files.

>...[deletions]...

I'd think that it emulates a "disk" the same way it's done
on the 130XE or a NEWELL 256K 800XL.
With the virtual disk being simply linear memory, it is
most likely that it is emulated at the SECTOR level.
One way to find out for sure is to load up an Atari sector
editor/viewer. You won't be able to actually 'edit' a
disk in memory the same way as with a physical disk I suspect.
I've never tried to do that, but something tells me that
there's got to be a "catch" of some sort.

Anyone attempted this and know if it's possible?

> Analogue or Antic or

I think you're wrong. Doug Neubauer was interviewed by ANALOG
in 1986. I doubt Mr. Miner would have done an interview with
ANALOG because they were Atari ST enthusiasts all the way. Their
opinions of the Amiga were something "Neat, but so what. Costs
too much."

> somesuch and any question that related to Ataris beyond about
> 1980 was met with 'Don't know'.

Not entirely true. He wasn't certain if GTIA had been used, but
otherwise there weren't any questions like that.

> As far as I could tell he basically designed the chips and left.

Neubauer did the POKEY chip. He stated that Steve Mayer, Joe Decuir
and Jay Miner were at Atari before him.

> Now, this is open to dispute but I'm *sure* in the interview he
> says he wrote Star Raiders as a test of the hardware and wrote
> most of it before the chips even existed!

Neubauer did write Star Raiders. Never said he wrote it before
the chipset was done. He had done some starfield demonstrations
while at National Semiconductor.

> Others say he didn't and someone else wrote SR. In the interview,
> I remember him saying he was a hardware person (obviously) but
> knew enough code 'to get by'. He also said the 3D routines were
> done the hard way with lots of maths as at the time, the state of
> the art in 3D algorithems was about zilch.

This clinches it, Doug Neubauer not Jay Miner.

Don't get too excited yet. I just tried out SR on it. It works
except for one important thing. No PMG collision checking
means you can't destroy Zylons.

That rules out many, many games at this time. It's one of the
things to be added in 3.0... stay tuned.

D.N. is a god, plain and simple. And he stuck with Atari up until around 1989 (Radar Lock) working on the 2600. Too bad he didn't write too much software. If only he could be called to duty with the Jaguar.

I was not aware he was also a hardware guy and that he was part of the design team. It does not surprise me since he seems perfectly aware of every nuance of the 2600 and Atari 8-bit archetecture so he can force it into his bidding.

In a message dated 6-27-94, Bob Lange said:

"I wish I had the space to keep all of the machines that
I have known and loved up and running, but time and the
high cost of electricity prevent that".

Well, unless you either live in an area where electricty costs more
than it does here (10 cents per kilowatt/hour), and you are one of
those folks who only power down their systems during thunderstorms,
I do not see how the cost of electricity could be that "high". Most of
the older systems (such as the Atari 8-bits) use about the same amount
of power (including that used by the monitor) as the lights in the
room you are setting in.

Okay, here is what you do:
1) send the money to Bob.

2) about a week after, then call him and whine about the R:P:. Believe it or not, he actually knows most of his customers by name. He knows my voice by heart. I really don't like calling him because he is a busy man and whining does nothing productive. I've had it out with him around march or so over the R:P:. You know, I whined about how this was my ONLY way to go high speed with the MUX, and all that. At the time Alfred spread a bad rumor that Bob would never release it so I HAD to find out the scoop from the horse's mouth.

He will most assuredly be pleased to get the shareware donation, and thus he will be very respectful to you over the phone! Not that he gives anyone the cold shoulder, mind you. Technically the CSS number is an order line, but it's also an unofficial support/help line. I called Bob to get info on Percom repairs. He referred me one Bob Burtt and that was nice of him. He also debugged a problem I was having with MYDOS over the phone. He had me go into the MUX 6502 monitor and via questions over the phone and me reading off hex values to me he determined that my file buffers were set too high. Now THAT is experience in action.

I've got a lot of repairs done through him and I bought my floppy board from him as well. I got both the MUX and the BB used, but I have gotten A-1 service from CSS despite this fact, from free EPROM updates to a whole new MUX slave cart to replace a flaky one, almost all the service on CSS hardware being either free or minimal charges.

I sent him $75 to cover Bobterm, the arc utilities, and Diskcomm. As much as I've been a pest I know that he knows that I'm not a shareware freeloader like most 8-bitters are. In some part I have helped keep Bob into the scene by lavishing praise on him, purchasing items from him as they become available, and paying for his shareware. Unfortunately there are many who are not as responsible. And this is what contributes to the depression which an 8-bit developer can so easly find himself in. It really only takes a few people to lift up someone's spirits. God knows CSS isn't making Bob rich. What these people want is respect, thanks, and monetary support.

So, what I did was vow in the case of R:P: not to pester him any more.
So it is up to other people to call in and glean info from him as to
release dates.

Well people, thanks to PC Xformer 2.0, I have FINALLY found out why I'm constantly getting 'bad CRC' errors when unarcing a program from umich. The culprit? Apparently, I had an old version of Charles Marslett's UTIL program that failed to write binary files correctly (read was fine).

What I did was I arced up a program from my XL, xferred it to the PC via UTIL, ran SuperUnArc 2.4 from PC Xformer, it performed flawlessly, I was able to unarc & execute the program with no probs. So I went back the other way, and voila, attempting to unarc the same program on my XL gave 'bad CRC' errors.

So I FTPed over to umich and found a newer version of UTIL, unarced it from PC Xformer, tried it out, tah-dah, no more CRC errors coming from my XL!

I'd just like to give Darek Mihocka a BIG thanks! Oh yes, and thanks to those who responded to my original message.

Ok, I know I've been whining about this since I first got my SIO2PC, and now that the XF2 is out and it happens to be capable of using the SIO2PC's ATR files, it sounds like we REALLY need a DOS app. which converts DCM to ATR and/or XF2 (preferably ATR because there are TWO programs which use ATRs, versus one program (on two platforms however) which us XFD's..

ANYWAYS, does anyone have any idea on how DCM files are stored? Hows about ATR files!?

Also, maybe a nice MyDOS-Compatible file-from-ATR extractor would be useful (and of course <sigh> a Sparta-Compatible one hehe ;))

Anyways, anyone got spex on these file formats!? Hell, it's something even >I< could do! (in of course QBASIC <sigh>). I could always make an Action! version and compile it! :)

I love Action! :)

PC Xformer 2.0 is NICE, but it would be alot NICER if it could toggle between 40/80 columns AND support MAC65!

I tried the file version of Atari Assembler with PC Xformer and it worked with no probs (run at $A000). Sad to say, the file version of MAC65 (v4.20) does not want to work with MYDOS 4.50 (MYDOS45.ATR). I believe MAC65 only works with SpartaDOS? Does SpartaDOS work with the 400/800 OS? If so, can anybody with SIO2PC supply a disk image for use with PC Xformer?

What I'm wishing for is the ability to work with MAC65 via PC Xformer in 80 columns. I've gotten so spoiled programming with an 80 column full-featured text editor on my 486 that I just cringe when working with MAC65 in 40 columns.. ahh, it ain't all that bad. Anyways, I would save the tokenized .M65 file to a virtual disk, then access it on my XL via SIO2PC (not yet installed) for compiling. Or maybe even compile it with PC Xformer, faster? Of course, the file and cartridge versions of MAC65 are not totally the same (seems like it tho).

Come to think of it, the whole idea seems more of a hassle?

Hmm, maybe it would be alot simpler if I just asked Fined Tooned Engineering to write a MAC65 compatible 6502 assembler for the PC. ;)

3509. XF551 EXTRAVAGANZA

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-01 04:52:36 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407010452.AA132948338@relay2.geis.com>
Source record: 100188

Mama mia, I'm still getting inquiries about those XF551's, over 11 now.
Folks, I only had 4 working ones to sell, they're all spoken for-
several times over! Please don't ask for a working 551 any more.

Still got the junker, tho. $25 plus shpg for anyone brave enough.

I received 3 or 4 coms from folks who deluged me with questions about the
differences between the 551 & the 1050. Regrettably I just don't have time
to answer those individually. Not long ago there was a thread in the newsgroup
on just this topic, maybe someone should renew this thread???

Seems to be an awful lot of people out there hungering for a 551.....

>second is a copy cart binary program that made exe's out of cartridges as
>well. As far as something that will convert the image to a executable I
>don't know.

Let's see (digging far back in the recesses of my mind!)... I believe to make the image into an executable, you need to write to the disk file the following:

FF FF s0 s1 e0 e1 DATA s0 s1 e0 e1 DATA ...

s0 s1 represent a start address in LSB,MSB format. e0,e1 represent an ending address in LSB,MSB format.

The first block of data can be the cart data. So you'd likely have
FF FF 00 A0 FF BF [8K of CART DATA]

Now, the tricky part, how to get the sucker to RUN once you've loaded it. I think you need to load a run address into $2e4 and/or $2e6 (I don't have my "Maping the Atari" handy -- sorry!). The difference between the two is that one ($2e4?) will cause the code to execute immediately after DOS finishes loading that single block of data from the disk, but the other ($2e6?) causes the code to execute only when the entire load (i.e. all blocks of data in the file) have been loaded.

So... how do you get the cartridge run address? It's somewhere in $BFxx. Unfortunately I can't recall the exact address. There is both a cartridge "init" and a cartridge "run" address. You'll want to put the cartridge init address into the "immediate-run" memory location ($2e4?), and the run address into the "final-run" location ($2e6?). So, for an 8K cartridge, you'd have something like:

FF FF 00 A0 FF BF [8K of cart data] E4 02 E5 02 00 A4 E6 02 E7 02 00 A0

In this example, the cart init and run are set to A400 and A000. Note that these addresses are merely examples -- again, you need to determine these addresses from $BFxx in the cartridge data.

All of this done, the cartridge still might not run if it has any self modifying code in it, i.e., code which attempts to overwrite the data

in $a000-$bfff. Of course, when running from a cartridge, the addresses $a000-$bfff are ROM, and so any stores to these locations will do nothing. In RAM, however, such stores will overwrite the cartridge data itself, generally causing havoc. "Centipede" is an example of such a cartridge (there are probably several more). Atari BASIC is an example of a cartridge which can successfully be run from disk (as is Star Raiders, though to run Star Raiders on an 800XL or any 8-bit with bank-switched memory requires patching the cartridge executable on disk to eliminate some stores to $D301, the bank-switching port on the Atari).

3511. Re: Jay Miner

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-01 06:10:48 UTC
From: jharris@cup.portal.com
Message-ID: <116032@cup.portal.com>
Source record: 100192

Jay's death was caused by heart failure, due to kidney complications.

I'm really disappointed that I never got to meet him in person. I truly consider myself one of his biggest admirers, and will continue to program the architecture he gave us for as long as I possibly can.

Having programmed 2600, Atari8, and Amiga chipsets, I've really enjoyed how many similarities there are, and how many improvements. In fact, the newer designs were obviously a direct result of trying to improve the weakest link in the previous design. That tells me that the hardware and software designers worked together, and that the designs were created directly to enhance the ability to program them. This is what sets these machines apart from all of the other fluff in the marketplace. For me, programming is the ultimate form of computer enjoyment, and I don't know anyone else who has even tried to create the kind of programmer's dream systems that Jay Miner and his team created.

Thanks go to Glenn for his kind words, but I do not consider myself qualified to write that type of article, being a person that has never met Jay Miner. It deserves some more personal details, that I would not be able to provide.

I did chat with Jay a few times through his BBS, "The Mission." (As in Padre -- the father of the Amiga). He did not care that much about the Atari8 architecture any more, or what was being done with the machines. This saddened me of course, and really came as a surprise. Part of me can't help but think this was caused by some bad treatment from Atari Corp. They burned so many other bridges in those days.

Jay did still keep up with, and associate himself with the Amiga when I talked with him. But he had no plans to do any more computer related graphic chips.

>Okay, everybody is answering how to get the Atari software to the IBM
>for XF2 use....how do you create a disk image on the Atari (or IBM) so
>you can run more than one program in XF2? Is it buried inside the SIO2PC
>program? maybe the ST Xformer?

Simple, just use the sio2pc software to create a disk immage in ram and save it to your hard disk, or if you want a larger partition, use the custom disk size option under create...this file is saved to disk as it's created.

Now, load PC-Xformer and either MyDos or AtariDos as your d1: and the file /disk immage you created as d2: and format as you would on a standard 8bit system. With MyDos you'll have to set the drive options if you plan on using a large partition...I've set up a 16meg partition under mydos...

to get files on to the new disk, all you need do is send 'em to your MsDOS machine via modem or down load 'em from one of the services...PC-Xformer can load these files as if they were disk immages themselves...you'd set your main disk immage as d1: and the file you'll want to copy as d2:. then just copy d2: to d1: and your done.

BTW SuperUn/Arc scrunch and Dskcomm all work great under PC-Xformer...jut be sure your setup a blank disk immage using the sio2pc software first.

Hi!
I really want to play Star Fleet I:The War begins! by Interstel on my 486.
I got sides A and B of the 8-bit program into XFD format.(Good thing I
didn't toss my ST!) Anyway I have side A as one virtual XFD and side B as
another XFD. SFI runson my 486, but when I start a mission I have to switch
sides of the the disk! Any ideas how I can get around this on the emulator?
If the emulator would run in DS or DD, I could everything in one disk.
I wonder if I could get DOS 4 to work on it? I think I have the
last Atari DOS somewhere too. Was that called DOS 5? It's been so long I
forgot.
Here's some of the games I've tested on XF 2.0:
Crystal Castles: Won't run
Last Star Fighter: Runs, but slight graphic corruption and really needs sound.
Super Pac Man: Runs, Some screen corruption though
Millepede: Won't run.

KK> platforms however) which us XFD's..

But there is such a program! I've converted all (well, almost all) of my DCMs to ATR! It's called DiskComm3 and it's by... Bob Puff! <g>

I got the most recent (I think) version off of GEnie two days ago and unpacked the DCMs that I had already transferred to IBM for ZIP compression in 1990.

Create a large ATR with all of your compression tools on it. Make a copy of MYDOS45.ATR with the DCM's filename, then load XF2 with the copy in slot one, the compression utility virtual disk in slot two and the actual DCM file in slot in slot 3. Here, look at this batch file I wrote to do it automatically:

---------- Snip! (Ow!) ----------

```
@echo off
CLS
REM ATUNCOMP.BAT - Uncompress Atari file(s) batch
REM created on 940628
REM
REM PARMS: %1 = compressed file name
REM %2 = compressed file extension (i.e. scr, shr)
REM
copy mydos45.atr %1.atr
xf2 %1.atr util_ml.atr %1.%2
```

---------- Snip! (Ow!) ----------

Then, Sh-F10, load binary D2:DSKCOM32.OBJ, punch "C" twice, "E" once and "B" once, type in the filename on D3: and away we go!

I'll admit that if there was an IBM program that could do the conversion directly it would be a lot faster and easier, but are you going to contact all of the authors of all the different disk compressors and ask them to do it? I doubt that Mr. Puff (bless his heart) has the time to do an IBM version of DC3, let alone the inclination.

Now for the bad news. Any diskette that used track-based software copy protection will not run, as virtual disks have no tracks. But any sector-based schemes should work, within some limits. The majority of games that did _not_ have a custom DOS or loader will convert. As to whether they will run under XF2 is questionable.

I have converted disks using Shrink2, Unscrunch and DiskComm3 to virtual disks with some success. (Shrink2, for some odd reason, always reports an overrun, but the programs work regardless.) For example, anyone for all three episodes of Hellfire Warrior? <g>

The major caveat that I can see to converting disks like this is that there is a physical limit in XF2 to how large an IBM file can be imported. It's somewhere between 80 & 88KB. I was able to import MECH2.DCM (Mech Brigade disk 2) which was 80K or so, while EIDOLON.SCR (The Eidolon) weighed in at 88K and would not import.

JC> my Amiga. :-)

You're trying to run an Atari 8bit emulator on an IBM AT emulator in an Amiga. Eeeuuuuuwww. <g>

Compatability issues aside, you're not going to be able to run XF2 at anything approaching normal speed with that setup. The docs give a speed of .3 normal for a 16MHz 286; I'd imagine that yours, when working, would give a speed approaching .2 normal. Not a very enticing proposition.

On my 386DX/40 (ATI 512K VGA Wonder, 8MB RAM, 430MB HD DOS 5.0), I have to slow down a few games (like Crossfire) to make them playable, but I still wonder at how slow ARCX runs. Or any of the Life simulations in BASIC. We're talking slo-o-o-o-owww. <g>

I have 3 controllers that I am unable to identify. Would somebody be able to help?

1. This one looks like a light-gun. The gun is black, has a trigger and a 5-pin DIN connector. The latter has 3 of its pins wired.

2. Epyx 500XJ, Nintendo connector. Has a red stick, shaped for the holding hand, and sports a nice body with 2 red rectangular buttons on the right side, as well as "start", "select", "autofire" "on" "off" on the basis.

3. Another inidentified joystick with a DB-9 connector (like Atari's), shaped like a pistol base, joystick button is a trigger. On top is a brown know with the number 1, movable in 4 directions + potentiometer (the latter is same as found in paddle controllers).

If anybody can help, please e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU.
Moreover, if you see something you can use, please make a reasonable offer.
In the likely case that I can't use there controllers, I'll gladly sell them.
Thanks!

> to virtual disks, doesn't it?

I think you may have just been extremely lucky. Diskcomm and
Scrunch aren't really compressors, they just don't contain
the empty sectors.

I'm surprised you got even one to work, because a header or even
one missing sector would make the disk unbootable (for example,
the directory would be at the wrong sector.)

> Well, on to the reason for this article: I'm missing a copy of

Can anyone tell me what the number of bits are for each of the following for a standard Atari 8-bit?

(1) registers:__
(2) external data: __
(3) external address: __

Are they all 8?

Thanks,
Tim

Well, he'd have to be a fanatic, only an Atari fanatic. All you have to do is look at the Jaguar threads in one of our sister newsgroups to see how far programming has sunk (re: Ansi C).

The standard phrase goes:

"Id is having trouble because there is no C compiler for the Jag. My God they have to program in ASSEMBLER! The horror!"

Thus Id comes up with 160x180 resolution on the Jag while AvP does 640x400. It isn't a hardware problem, it's coders who don't know how to write optimized assembly and who still don't know how to tap into the chips. C coders don't have to know much at all about archetecture. But Neubauer realized that the more you know about the hardware, the more you can manipulate it directly, the more you can get out of them. These days archetectures are disposable so that attitude isn't very prevalent anymore.

It isn't so much that a given archetecture can do something, if it can't do it via compiled C at a given speed, then it isn't powerful enough because noone will stoop so low as to write assembly.

Obviously Id was running C code through the 68K... A sad case indeed.

8 bit internal registers. 16 bit adress bus (65535 bytes linearly
addressable).

The 65C02 adds a few new opcodes.

The 65802 adds 16 bit internal registers.

The 65816 adds a 24-bit address bus.

Ok, from what I've seen and heard of the side A of the Cool Emotion(s?) demo by The Hard Software, I love it! (Even that really lame wanna-be demo at the beginning which was the 'grim joke')

BUT! Once I get to the second part of the demo (btw, I love how well the music plays during disk i/o! :)), and is about to show me the "big plasma", it dies.. I can see some stuff still flying (scrolling) around on the screen, but the music freezes (one looooong note :)) and the screen just goes all ikky..

Anyways, I'd love to see what else is on that thing! (it's a nearly-full 1050 disk and it only gets past maybe 1/3rd or 1/4th of it!) That part of the demo does not let you continue <grrr> while the sine-wave scroller is going, so I can't just skip it right away (like I can on some of the Hobby/Halle NTSC-crashing demo parts)

Should I just get my hands on a PAL machine!? :)

I even thought of running it in 800 mode, but yeah right, like that'll work! :)

BTW- Will there be a PAL version (50 vs. 60 on NTSC) of the XF2!? Or a 'swtich' or option for that!? That'd be RAD! :)

I always wondered why most cartridges allowed you to do this. It would
have been trivial for the cart designers to make the cartridge init
code NOT return to the OS before running at the cart run address. It
baffled me for a long time why I couldn't do the "boot with START key
to dump cartridge" trick with Star Raiders. After understanding the
difference between the cartridge init and run addresses, I then wondered
why any cartridges (games in particular) let me do it at all!

3536. SIO2PC disc images

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-02 04:12:58 UTC
From: eric.palm@drs.state.ct.us
Message-ID: <9407020000303046@drs.state.ct.us>
Source record: 100109

Someone mentioned that they wanted to be able to copy multiple files to an SIO2PC disc image.

I've found just the program that will do the job. It's called S2PC.COM It goes by the archive name of S2PC.ARC on atari.archive.umich.edu It will allow you copy to and from SIO2PC disc images, but only if they were formatted with MYDOS. Any sector size up to 65535 will be allowed.

I used it to copy about 6 megs of files I had in a driectory on my PC, I was going nuts with the MAKADISK program for 1 file at a time. What a runaround.

Eric.Palm@drs.state.ct.us

3537. Re: Atari 8 bit emulator for AMIGA?

>have to with a 68K emulating an 8080,Z80,8088,x86 processor in software,
>but you still have to do the rest of the CPU emulation.

No. The 6502 and 68K are backwards. The 6502 and x86 processors have the
same byte order, which is one reason why Darek's PC Xformer runs a lot
better than the ST 68000 based version did.

>However, the Amiga lacks one thing that the Atari has: true text modes.
>
>John tells me the slower older Amigas can't really push text at speeds
>that even the Atari can (with custom routines like Bobterm and
>FlickerTerm). Kinda proves how important text modes can be!

This is true, and still has me a bit disappointed regarding the Amiga
architecture. I found cset graphics extremely useful, and really miss
having them, as well as high speed text ability.

PC Xformer is still in the same situation though, since everything is done
in bitmap graphics. You couldn't get the right character set, or ATASCII
graphics through VGA text modes. (I don't think).

Actually, I'm not as excited about Atari8 emulation on the Amiga as I once
was. One of the big benefits of PC X-Former is being able to run it on a
portable computer, and no one ever made Amiga portables.

John Harris - jharris@cup.portal.com

Ivo van Poorten (ipoorten@cs.vu.nl) wrote:
: Hello,

(yo ivo! ook al een emu aan het coden ?! :))

: Now I have a question. I know I have to emulate the ANTIC and the GTIA
: completely (graphics), but what parts of the POKEY and the PIA should
: I emulate? For example, do I need to emulate keyboard interrupts and

you indeed have to generate a keyboard interrupt.., when a key is pressed,
set the keyboard interrupt bit in the IRQST reg, and generate an irq,
then when the atari OS reads the KBCODE ($D209) reg return the internal
atari keyboard value of the key that was pressed..

: disk IO interrupts? Also, do I need to emulate the serial transmission
: between the diskdrive and the computer? Or should it be enough to 'trap'
: all SIO (serial input output) calls with a small C routine performing
: the same action(s)? How is this done in other emulators (for example
: the Apple2 and C64 emulator(s)?

in my emulator (also Atari XL/XE) i did both, interrupt driven, and with
a SIO vector trap. at first i only implemented the vector trap, most
programs and DOS'es worked OK. but then i got Sparta-DOS.., which didn't
work with it, cause it doesn't use the SIO vector at all, but does its own
serial io ...
i think the best is to completely emulate the chips, and don't use
traps at all, that way you can also use OS'es which have a different
memory organization ...

: I hope somebody can help me out on this.
: Thanks in advance,

: Ivo van Poorten

We have aquired a load of old copies of Page 6 and Atari User (the British one). We have vertually got a complete set of Atari User, and all Page 6 from issue 35 onwards. In total, we have about 100-odd mags to clear.

The price is just $1 a mag + shipping which is going to be WAY more! I think it costs maybe $5 for 5 mags via surface mail.

If anybody wants some of these mags then just send us some E-Mail and we'll see what we can do!

Why not? Perhaps there was a quality in the Atari version that the Apple
version lacked (ie: playability, music, etc..) If we go with the Atari
originals idea that means we can't count Defender, or Donkey Kong, or ...

My favourites: Donkey Kong, Mr. Do, Dog Daze, Pharoes Curse,
Choplifter (how's that for Applesmackle), Gyruss, Jumpman, and countless
others (in no apparent order..)

DUH! I know of DiskComm! I just want to be able to load DCM files to SIO2PC! It's not because I'm so LAZY as to load up the DCM and then rewrite it to an ATR file, it's just it doesn't always work right! (The ever present ERROR 139).

Anyways, "I'll admit that if there was an IBM program that could do the conversion directly" is exaclty what I was SAYING! :)

Sheesh! :)

And if that was sarcasm, then it was a waste of bandwidth! :)

Why can't XF2 do disk images above 80 / 88k ?? SIO2PC does em just fine (either loaded into memory or accessed physically (which is minutely slower, even on my peice of crap computer.. when I boot MyDOS, which is a 360k disk image, I do it with the "/p" otherwise it takes about 15 seconds to load into memory!! I don't NEED all 360k! I need DOS.SYS, DUP.SYS, and every once in a while other things like TBAS.COM, UNARC24.COM, DSKCOM32.COM, etc.. I know I should make a smaller MyDOS boot disk image with very few things on it, and I did, but I got sick of having so many MYDOS*.ATR files! :)))

In a message dated 7-1-94, Joseph Cohen said:

"1. This one looks like a light-gun. The gun is black, has
a trigger and a 5-pin DIN connector. The latter has 3 of its
pins wired."

If you had said 6-pin DIN, I would have nailed it as a Sega light
phaser that was modified by one company for use with a couple of
CoCo 3 games ("Iron Forest") being one. However, the Tandy joystick
port is a 6-pin DIN. However, I suppose it is possible it actually
used the cassette input, which is a 5-pin DIN.

I will try to remember to ask on the Color Computer Forum here on
Delphi and see if anyone can verify my hypothesis.

If it is so, It should be possible to easily remodify it to work with
the Atari 8-bits, or a Commodore 64/128.

3547. XF2 and Sprites and Graphics 9

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-03 00:49:45 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940702175000.238014cc@sonoma.edu>
Source record: 100127

I checked out ColrView 2.5 with XF2. Cool! 64 color mode works!

BUT!... 4096 color mode is just grey! At the very top I can see some of the border (which due to stupid VGA cards is really just bitmapped stuff, ie, the top 4 lines and bottom 4 lines are probably being used because standard Atari modes are up to 320 x 192, so there're 8 extra which can be used as borders) and it's going through red/green/blue, but the actual Graphics 9 bitmap image is just grey.. I'm supposing THIS wouldn't work right then:

```
10 GRAPHICS 9
15 COLOR 10:PLOT 0,0:DRAWTO 79,191
20 POKE 712,16
25 GOTO 25
```

On the XF2, it'd just stay grey and the 'borders' would turn dark yellow.. hmmm

THEN, I tried out Sludge.. it uses Sprites (PMG) as cursors (like Cultivation does: Graphics 0 redefined text with a sprite blob which changes the background color behind the foreground text/graphics).. BUT, I guess XF2 doesn't understand GPRIOR (priority register) and when the cursor moves around, it's just solid, not a spiffy looking change in the background screen.

ANyways, I guess I shouldn't babble about it here as much as I should write the guy a letter, huh!? :)

Source record: 100128

Ok, it's great that the xf2 emulator can have virtual disks, but can
it also emulate enhanced disks(1040 sectors)? 720 sectors is _not_ enough
for many programs, since some single applications take up a whole enhanced
density disk. Is there any way of creating such a virtual disk? Can xf2
emulate DOUBLE density disks? If so, I'd put SpartaDOS as a virtual disk
and use that instead of the 2.5 DOS.

Also, anyone know how to start (boot) the emulator without BASIC?

thanx.
Victor

I have an original Atari 800 that works great -- has Omnimon machine
language
monitor installed and also an XL-switch so it can work like an XL
with the
alternate chipset. Also I have an original 810 drive that has been
enhanced
with the Atari archiver chip. Lots of software too -- carts and
disks. Also
an OKIMATE 10 color printer (if you can find the color ribbons, works
great)
with an Atari plug'n'play interface module. Also KoalaPad with
software, WICO
joystick, etc. All power supplies, cables, bag o' extras and goodies
(cables,
chips, ROMs, etc.)

Best offer over $200.
Please respond via email to DAVIDN9000@aol.com

From: KENDRICK@sonoma.edu
Message-ID: <940702220407.2380176d@sonoma.edu>
Source record: 100132

Currently, the PC X-Former does not access real Atari floppy disks, but if they are Double Density (180k) disks there are ways of reading them with 5.25" IBM PC drives. Most Atari disks are 88k disks and some (especially European demos) are 127k (Enhanced Density, Atari 1050 disk drive style) disks.

Anyways, if you want to use any of the software that you can download (ie, if you can FTP to Umich with your IBM (or at least get the files to your IBM) or call Atari 8bit supporting BBSes (again and get the files to the IBM)) you just add those files to the XF2 command on the MSDOS command line.. ie, I did this at my friend's house last night:

COPY DOS25.XFD BLANK.XFD <- in MSDOS, I made a new disk
XF2 MYDOS45.ATR BLANK.XFD <- in MSDOS, boot the emulator w/ MyDOS
DOS <- in the emulator, jumps to MyDOS menu
[I] [2] [Y] <- in MyDOS, formats drive 2
[F5] <- in the emulator, quits back to MSDOS
ATTRIB +R BLANK.XFD <- precaution measure, so that BLANK.XFD will always be un-write-to-able, only readable

That gives me (my friend, actually) a 'blank disk' to 'buy from the store'. Whenever he wants any blank disks for the Atari emulator, he must COPY the file "BLANK.XFD" to a new file "somethng.XFD".

Here's how I got a couple of my games onto a "Games disk" for hime:

COPY BLANK.XFD GAMES.XFD <- in MSDOS, I made a new disk ('bought one')
XF2 MYDOS45.ATR GAMES.XFD COOLTRIS.COM SLUDGE.COM <- in MSDOS,
now I have the following drives available to the Atari emulator:
D1: MyDOS 4.50 disk which I can read and write to and from
D2: The Games disk I just created.. it is 'preformatted' hehe
D3: COOLTRIS.COM, I can only read this (binary load, copy, etc)
D4: SLUDGE.COM, ditto
DOS <- in the emulator, jumps to MyDOS meny
[C] "3,2" <- In MyDOS, copies everything from Drive 3 (ie, the one file "COOLTRIS.COM" which sits on my friend's hard drive) onto Drive 2 (the GAME.XFD file, the "Games Disk")
[C] "4,2" <- Same thing but from Drive 4 to Drive 2 (copies SLUDGE.COM)
[F5] <- In the emulator, returns to MSDOS

Now, you can "DEL"ete the files "COOLTRIS.COM" and "SLUDGE.COM" from the hard drive because they now exist within the disk image file "GAMES.XFD" (as well as about another 65 or 70k of empty space ('free disk space')).

Got it!? There is currently no application which translates Atari disk image files (".DCM" files, made with and used by DiskCommunicator 3.2) into IBM Atari disk image files (".ATR"s for SIO2PC, which I'd love to have because of the

trouble I have with DiskComm. and my SIO2PC server .. as well as the ".XFD"s for the Atari emulator PC X-Former 2.0.).

If you want to take a game or a demo, say DAS_OMEN.DCM available on the archives, and run it on your XF2 emulator program (if it WILL run! :)), you must do this:

1) Follow the above steps shown for COOLTRIS and SLUDGE (put the file on the command line) to the file "DSKCOM32.COM" (Disk Communicator 3.2). You don't need to use a blank disk, just put this (and Super UnARC and stuff) onto the MyDOS 4.50 or Atari DOS 2.5 disk images. Example:

XF2 MYDOS45.ATR DSKCOM32.COM <- D1: is MyDOS, D2: is DSKCOM32.COM file
DOS <- jump from Atari BASIC to MyDOS 4.50
[C]opy "2,1" <- Copy DiskComm3.2 onto the MyDOS 4.50 disk

This should be the last time you need to do this for DiskComm unless you kill (or change) your boot disk images (DOS25.XFD and/or MYDOS45.ATR)

2) Make a new blank disk which will store the disk image which is currently within the ".DCM" file:

COPY BLANK.XFD DAS_OMEN.XFD

3) Run DiskComm3.2 from the emulator:

XF2 MYDOS45.ATR DAS_OMEN.XFD DAS_OMEN.DCM <- note which is which! :)
[Shift][F10] <- I don't know if DiskComm works with BASIC enabled...?
You are now in MyDOS because the system rebooted without BASIC
[L] DSKCOM32.COM <- Load DiskComm from the MyDOS menu
[C] [C] <- Change source from D1: to D3: (where the ".DCM" is)
[D] <- Change the destination from D1: to D2: (where the
yet-unmade XF2 disk image file of DAS_OMEN is)
[B] DAS_OMEN.DCM <- Create a disk from (a) File(s). Option [B] in DiskComm
[Return] <- Uhh.. :) Source disk is already in drive 3 hehehe
[N] <- No need to reformat D2: because DAS_OMEN.XFD is already
formatted (remember, it is a copy of BLANK.XFD which
we formatted in MyDOS before we "ATTRIB +R"d in MSDOS)

Sit back and relax while it reads from D3: and saves onto D2: ...
DON'T do a [G] coldstart because the DAS_OMEN.XFD disk image is D2:, not D1:.. if you reboot (coldstart) you'll just get BASIC again..

Now, whenever you want to run the DAS_OMEN demo (now you can DELete DAS_OMEN.DCM), just do this:

XF2 DAS_OMEN.XFD <- In MSDOS, in this case DAS_OMEN is the boot disk

AH! BE AWARE! Opps, XF2 has no way of booting without BASIC on (unless it recognizes [Option] ([F9] on IBM keyboard, right?)) when you load it up, so do a [Shift]-[F10] right as it loads and then it should work.

Also, I may have used a bad example in using DAS_OMEN.. I mean, that thing didn't even work right on my 1200XL until I get the real 800XL OS installed, so

the thing probably works even worse on an 800 (NOT XL) OS, and probably like CRAP on a 80%-or-so working Atari 800 EMULATOR!!! :)

I guess I chose it because I heard "XF2" doesn't handle Atari-1050-drive-sized disks and most demos and stuff (in ".DCM" format) are Atari 1050 disk images.

ALSO! Another note, a good thing to have for your PC if you use XF2 is an unARC program.. these are good for unARCing ARC's which have one or two files in them or for looking inside of ARCs without loading the XF2. I'd imagine it'd be crap to have to unARC something and then put ALL of the files that you could (6 or 7, depending on if their destination is a boot disk image) onto the command line and then copy them one by one.. Just get SuperUNARC 2.4 for the Atari emulator! :)

BUT! I may be wrong about even needing that if you have the program "S2PC".. I haven't looked at it yet and don't remember exactly what I heard that it does, but it does something with disk image files (ATRs probably) - either reads out files from within them (they must be MyDOS (compatible)) disks and saves the files it reads onto the IBM's drives, or it saves IBM files onto disk images (that'd be cool!.. the S2PC program would have to in a sense emulate MyDOS more than a simple reader program) or it may do both! Cool! :)

Wow, what a long post.. :)

>others (in no apparent order..)

WayOut! had a larger active screen area on the Apple][, and so was
superior on that platform. Choplifter lost everything by going to
a discrete position joystick with just one button, and so was much
better on the Apple. They lost something in the port. I like to
count only games written from the ground up on the Atari.

Arcade translations are good examples of games written from the ground
up, at least with regard to graphics and sound. Donkey Kong and Defender
are excellent examples of exploting the Atari 8-bit's capabilities.
In fact, I would put Atari 8-bit Defender somewhere between arcade
Defender and arcade Stargate. The ports of original Apple games to the
Atari 8-bit just did plot-and-replot, and inevitably lost a lot in
the port because the Apple had more colors than the Atari, and
also different joysticks.

So I like to count only native code, not ported code.

3554. SIO2PC cable, and XF2

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-03 07:41:23 UTC
From: plf@bert.cs.byu.edu
Message-ID: <plf.773221283@bert.cs.byu.edu>
Source record: 100134

Hi, I just got XF2 (the atari emulator for DOS) and it works rather nicely, but I'm wondering about the XFD disk images ...

In the docs, the SIO2PC cable is mentioned, but never fully explained. Any docs? Also, how easy (or impossible) would it be to rig up an SIO2PC cable and connect a 1050 disk drive to a PC's parellel port, then run a program that makes an XFD file? The doc's mentioned such a program for the ST, but not for the PC.

Any comments/suggestions/death threats?

The current version of XF2 can handle disks with up to 65535 sectors,
single or double density. You can't use SpartaDOS 3.2 because it
requires an XE or XL and XF2 emulates an 800.

I've been in denial for a long time, but I think I'm ready to admit
that I will probably never get any more use out of my Atari 8-bit setup
that's been in storage for way too long. It's in good working
condition, though, and if you want it, it's yours for $200 or best
offer. The computer itself is one of the last of the 8-bit line- a
beige casing, 128k total memory- but for the life of me I can't recall
the model number. Also included is a sleek, fast Indus GT disk drive,
a nice Hewlett-Packard ThinkJet printer (paper and ink cartridges
included), and all the cables and that weird square connector box that
you need to hook it all together.

16 at once, but ONLY 16 to choose from vs. 128 on the Atari. Big
difference (I'd rather have 128 and fewer colors simultaneously (getmore
via DLI)). The Atari only had 4 artifact colors on Apple ports, red,
blue, white and black, depending on CTIA or GTIA configuration (there are
ways of doing more via dithering).

I believe I said it before, that Puff wants to market it at no higher
than $60, maybe as low as $50. Part of the pricing may relate with
whether he indeed ads a term on the ROM in the interface and whether it
indeed has a printer port, etc...

So we are talking prices at about the same as 850s and PR:s went for a
few years ago on the nets. These days usually nobody can getme than $40
for them.

A big step up for not much more money.

Otay!

I dug up the file I was talking about, but it isn't exactly voluminous.

Somebody try this and let me know if it works.

To modify a 1200XL keyboard to work on other models of Atari computers remove
the 15 conductor cable, ic chips, capacitors and resistors from the board and
connect wires from the 22pin keyboard connector in the computer to the locations
shown in the following diagram.
I have done this modification to a 400 and think it will work with all models.
I believe that the programmable function keys should operate properly on XL/XE
computers but the OS in the 400/800 does not recognise them.

```
2 8 10 14
1+ + + + + + + +8 1+ + + + + + + +8
3 5 11 13

1 7 15 17
16+ + + + + + + + 16+ + + + + + + +
4 6 12 16
19 21
15+ + + + + + + + + + + + + + +1
22 20 18 9
```

>hard drive and 1M MIO VERY happily and successfully.

I guess my first questing is why? I've seen a hacked version of SDX on
disk along with a hacked version of Action3.6 both of them slower than a
dead man rolling up a hill.

One of the things I like about the cart is the fact tht I get 4k more
free memory, Faster access to built in util's and have access to the
ram under os. If you go to a disk based version, most of the built in
util's will have to be re-written so as not to make lib calls...unless
you want to wait for the lib to load into mem each time you call a function.

I understand what you're asking for...a striped down version of Sparta.sys
and Command.com and maybe a re-write of Menu.com... Still, having used
SRP dos from CTH, I'd rather stick with the cart
What FTe needs to do is release complete developers kit's and information
on how the lib's can be used and how to use the built in relocator in
your own programs. Having this info would allow programmers to fix bugs
that currently exist when used with SDX...Ask Tom Hunt...(CTH)

Just my couple a cents...

Message-ID: <2v8ejv$576@usenet.INS.CWRU.Edu>
Source record: 100149

In a previous article, camba@ecf.toronto.edu (CAMBA VICTOR FABRIZIO) says:

> Ok, it's great that the xf2 emulator can have virtual disks, but can
>it also emulate enhanced disks(1040 sectors)? 720 sectors is _not_ enough
>for many programs, since some single applications take up a whole enhanced

Yes, PC-Xformer can handel ED disks...just remember, when making a blank
disk using SIO2PC make the disk image 130k also, be sure to remove the first
16 bytes from the disk image created by SIO2PC...A good ascii editor like
ted or gedit works great! Then just format as normal. Works great on
DD and larger disks, I'm using a 16meg image right now.

In a previous article, KENDRICK@sonoma.edu (mp/nr.29176.18282.followup -h /tmp/nr.29176.18282.headers) says:

>DUH! I know of DiskComm! I just want to be able to load DCM files to SIO2PC!

the one thing you have to be sure of is, the blank disk you create using sio2pc should be 130k and the first 16bytes have to be removed. Once this is done, I7ve never gotten the error 139 again.

Also, I've hit the 88k wall myself...tried to move a large arc file to save time...Still, most things can be arc'd or LHA'd small enough to pass through that window :> (remember to use the old lharc...I didn't and had to do everything twice)

I did try booting Hobby92a this afternoon...the disk booted okay and the ABUUC title screen came up fine...however, when the first demo loaded... crash city...(sigh) still the title screen looked good!

3575. XEP-80'S AVAILABLE

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-04 21:09:05 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407042108.AA073386127@relay2.geis.com>
Source record: 100056

I've decided I *really* don't need 7 XEP80's, 4 will do me fine.
So, I'm offering the 3 spare ones for sale.

Price is $55, includes shipping in USA (US buyers preferred).

These units are in mint condition, as-new, in the original factory carton
with all original packaging.

All come with original manuals, power supplies, & utility software.
All have been tested & guranteed functional. Two of them I think were
never used, other than to check them for functionality.

Two of them still have the original price tag on the box cover (eeek!).

First come, first serve. Early bird gets the worm.

Contact me to confirm availability: b.poehland@genie.geis.com

Gett'em while they last!

- Ben Poehland

3576. 8 bit software copyright position

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-05 10:32:42 UTC
From: moran@bnr.ca
Message-ID: <2vbcsa$reb@bmerha64.bnr.ca>
Source record: 100057

What is the position of 8 bit software in terms of
copyright now? ie Although it would not be strictly legal
to copy and distribute old games, surely in view of the
fact that most of these publishers no longer exist and
there is very little commercial benefit in trying to sell
them, the games could be put in an archive so that all
users of 8 bits could benefit from them. A centralised
archive of games and other software could be implemented
and software provided to users for free or a shareware fee.

Such an archive would also be great news for emulator
users. I see that many classic Spectrum games are available
for download so why not Atari 8 bit sofrware too...?

Gavan

It depends to an extent on individual countries law but esentially, it doesn't
matter if a company has dissapeared or not. They product has copyright and until
the copyright holder puts it into the public domain, you can't copy it legally.
Where a company has gone, the copyright on theirproducts would generally fall to
an agreed 3rd party either the programmer, MD or whoever. It can be quite hard
working out who exactly needs to be approached. ISTR some quite famous game (alt
reality?) turned out to be owned by some 80 year old grandmother!

3578. Disk Communicator program.

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-05 11:37:44 UTC
From: markh@inmos.co.uk
Message-ID: <1994Jul5.113744.13408@inmos.co.uk>
Source record: 100059

Hi 8 bitters,

I wondered if any of you use the disk communicator program by Bob Puff.

I have tried on-and-off to use this for some time, but although it loads
and appears to run, the disks created all have one common flaw....

Every sector written has the hex value 82 in place of whatever byte
should be the 3rd byte of the sector!

I have tried using Dos2.5, Mydos and Spartados, I've also tried
a stock 800XL, a 256k 800XL and a 130XE. I've also tried both
diskcomm.com and dskcom32.obj from various archives, and various
*.dcm files.

The only thing all these have in common is the disk drive (and me!)
which I think is a happy 1050.

Anyone help???

Mark.

Folks have been disputing this argument for years.. but the bare fact remains that most 8bit software still falls under U.S. copyright laws, right or wrong.

As far as distrubiting (c) software for a sharware fee - that would be a BIG mistake, in my opinion.

I have the following misc. hard/software for sale or trade. I prefer trades:

BBS Express Pro! node x324 complete with dozens of .CMD modules, commercial games like Nebula Elite, Chess, Tactx, Seawar and dozens of disks full of 3rd party software for the bulletin board package, including the latest file transfer protocols, file directory package, networking software, documentation, etc.. First $75.00 or best offer takes.

30 meg MFM FH hard drive (formatted on MIO, flawless)
40 meg MFM HH hard drive (formatted on MIO, flawless)
70 meg MFM FH hard drive (formatted on MIO, full of software, flawless)
185 meg SCSI FH hard drive (formatted on MIO, needs low-level format, 0 errors)
20 meg MFM HH hard drive (formatted on MIO, full of software, flawless)

Atari 410 tape recorder, with custom dustcover, flawless

Atari 1050 custom dust cover, flawless

Atari 800xl custom dust cover, flawless

3 x Atari 2600 VCS dustcovers, brand new in box

256k MIO, flawless condition

3 slave CSS Multiplexor, complete with 3 ROMS, documentation, original disk, and approximately 60 foot of 34pin ribbon cable

Hayes 1200baud Smartmodem

Internal 8bit 2400baud modem/9600 baud FAX card

4 x 16bit MFM hard/floppy controllers

AT&T 1200baud 2212 compliant modem

AT&T 4102 wide-carriage serial printer w/manual and extra ribbons

---

I seek the following items in trade:

New revision SIO2PC cable
2 line AT&T or GE phone w/hold, conference and programmable buttons
Koala pad
Music digitizer (for Atari 8bit..dont recall name)
Computer Eyes compliant black/white video camera
Black box
Commodore 1702/1802/1902 composite color monitor(s)
Any decent 2-4 head VHS or even beta VCR

decent 35mm camera
87 Z-28 Camero nose cover/bra
87 Z-28 Camero louvers

3581. External drive case for sale cheap

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-05 17:10:18 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00980F8F.AB4CD960@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 100064
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,comp.sys.tandy,comp.sys.apple2.marketplace

For sale-
External drive case, made by Texas Instruments, black color, housed
one full height floppy drive.
The case has enough power to operate a full-height DS/DD floppy drive.
It works fine and is in good cosmetic shape. I cannot, however, guarantee
that it will work under conditions beyond my control. It is working fine
now with the floppy drive and I would expect it to function normally
under reasonable conditions.

Asking $18 for the case without the floopy drive, and $26 for the case
plus DS/DD floppy drive included.

Please reply as soon as possible or by 7/10/94 to e-mail address
COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973.
Thanks.

Not only would it be "not strictly legal," it would be definitely illegal.
Anyone who chooses to put pirated software on an FTP site is blatantly
breaking the law and inviting lawsuits. High profile sites such as the
Merit/University of Michigan Software Archives (the "Atari Archive") will
never put their existance in jeopardy by offering pirated software.

3583. 8-bit Atari Emulator discussion (Please read)

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-05 17:44:51 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <2vc66j$jqu@usenet.INS.CWRU.Edu>
Source record: 100063
Cross-posted to: comp.sys.atari.8bit,comp.emulators.misc

The following is my opinion, I claim no authority.

The Usenet newsgroup comp.emulators.misc was recently created for a centralized discussion of emulators of other computing platforms. Other comp.emulators.* groups were created for emulators of specific platforms, but an Atari-specific one was not created. Discussion of 8-bit Atari emulators is relevant on comp.emulators.misc.

comp.sys.atari.8bit is for discussion of Atari 400/800/XL/XE hardware and software. XF2 (PC Xformer) is not among these, it is a DOS application. Questions and answers on using PC Xformer to run 8-bit Atari software on the DOS platform is not of inherent interest to users of the 8-bit Atari computers themselves, so it is not relevant on comp.sys.atari.8bit.

I propose all discussion about the _usage_ of 8-bit Atari emulators such as PC Xformer be moved to comp.emulators.misc. Questions and answers about _writing_ 8-bit Atari emulators should be cross-posted to both comp.emulators.misc and comp.sys.atari.8bit. Discussion about the 8-bit Atari itself, with no regard to functionality under emulators, remains on comp.sys.atari.8bit.

Please post followup opinions, if you have any. If there are no serious objections, I will add this policy to the 8-bit Atari FAQ, and I will begin politely reminding people of this policy if they do not follow it.

Thanks,
--

From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00980F95.45D2B400@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 100065

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

PLEASE REPLY AS SOON AS POSSIBLE or by 7/10/94.

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Monitor-
1. Monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.
There is a choice of either B&W or amber. The amber monitor also
has an inverse video switch.

Atari CX853 16K RAM memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool
Joysticks- various types and shapes, all tested and working well.
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)

Hardware for sale as-is:
Atari 1010 Program Recorder - belt of mechanism inside came off.
Atari 1010 Program Recorder - save: ok, load: no.
Main units only, without cables.

Atari Paddles- used, untested, look ok but sold as-is.

Power supply cable for XL series. Non working, but may be useful, e.g.,
for those who want to convert to an IBM single power supply and need the
part of the cable that includes the plug for the computer. Or whatever!

***** SOFTWARE *****

Cartridges-
==========

BASIC (CXL4002) withlike-new manual.
BASIC (CXL4002) without manual.

Disks- (All are original disks)
======
TimeWise with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Atari Translator
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler

plus about 50 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual

Books-
======

Bill Carris- Inside Atari BASIC
Albrecht, Finkel and Brown- Atari BASIC
Original box for 1050 drive (drive not included, only box)
Atari 400/800 News Bits published by Atari, Number one 1979
Number two 1979
Atari 410 Owner's Guide
Atari 410 manual
Atari 820 printer manual
Atari 400/800 Personal Computer 3-ring binders
Oasis BBS manual (printed on a dot-matrix printer... in case anybody needs...)

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

Please reply by 7/10/94. Thanks!

3585. Re: 8-bit Atari Emulator discussion

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-05 19:10:11 UTC
From: fontana@cis.ohio-state.edu

> the DOS platform is not of inherent interest to users of the 8-bit Atari
> computers themselves, so it is not relevant on comp.sys.atari.8bit.

I must disagree. Broad, general newsgroups like "comp.emulators.misc" can be a nuisance to read (sifting through articles that you have NO interest in but which happen to be clumped into the same group... like maybe a dozen postings on the hot new CP/M emulator, interspersed with a few postings on PC Xformer, and so on) Whereas, comp.sys.atari.8bit rarely gets more than 30 or so postings per day, and anyone who hates seeing Xformer articles here and there can simple add the topic to their killfile (which can be processed quickly due to the low traffic on c.s.a.8bit).

Not to mention the fact that most readers of c.e.m could probably care less about PC Xformer, and it wouldn't be particularly polite to hassle them with diverted traffic from the Atari 8bit community. Xformer has more to do with Atari 8-bit computers than it does with generic discussion of various emulators.

An example of such confusion can be found on comp.sys.ibm.pc.soundcard.*, where over a dozen sound peripherals are being discussed simultaneously... Picking out information on just one or two cards requires a longish killfile, and it's often easier to just mark everything read and skip these groups!

Finally, it appears that a substantial body of readers of c.s.a.8bit do use other computers, and quite a few are interested in rigging up their old 8bit hardware with SIO2PC, or digging out 8 bit software and playing with emulators on their newer multimedia PC's. Atari 8-bit users have always been a particularly enthusiastic bunch, and I see no need to banish any of them to an outside newsgroup.

> Questions and answers about
> _writing_ 8-bit Atari emulators should be cross-posted to both
> comp.emulators.misc and comp.sys.atari.8bit. Discussion about the 8-bit

> comp.sys.atari.8bit.

Where does SIO2PC fall under this routing scheme? It naturally involves 8bit hardware, but [uh oh!] it also involves a non-Atari machine and non-Atari software.

Again, I don't think this is necessary, and I bet you could find
more productive ways to spend your time than examining all these articles
and bugging people about them.

A few days after PC X-former was released, FTE released the
disk based MAC/65 v4.20 on GEnie. It comes on a DOS XL
disk image (it was an OSS product, SpartaDOS was ICD)

> Does SpartaDOS work with the 400/800 OS?

Unrelated to this, but only v1.1 and the X cartridge work on
the non-XLs... but I can't get PCX to boot v1.1.

Source record: 100068

Well, first off, Michael Current, you sound a bit pissed! Secondly, I don't see why the XF2 discussions must be forced OUT of the Atari 8bit newsgroup, I've on occasion on an IBM-based board had to explain things about MyDOS and Atari BASIC to people who are using the XF2. What would people on comp.emulators.misc know about Atari's or MyDOS or Atari BASIC, except of course the people who are also readers of comp.sys.atari.8bit. I'd bet anything that only a few of us c.s.a.8'rs read c.e.m even though we'd probably be quite helpful there when it comes to Atari's and the XF2!

Anyways, if anything, I think a new comp.emulator newsgroup sould be formed about the XF2 (and of course all other Atari 8bit emulators). Perhaps a comp.sys.atari.8bit.emulated might even be better because of the name and the close proximity (in alphabetical order) it will have to the c.s.a.8 group. Of the week or so I've been looking at c.e.misc, I've seen only a half a dozen or less posts about the XF2 and/or emulating Atari 8bits. Most of it is CP/M, BCC (or BBC or whatever) and other junk, most of which I've never heard of (hey, I'm young! :)).

>I< vote that we either keep XF2 and other Atari 8bit emulator discussions here (hey, it adds a little to the small bandwidth of this group!) or we make a new group.. I don't see why people who're just getting (back) into the Atari 8bit should be 'banned' from the group that supports it. Who said that this place is only for people who use the REAL machines with the REAL hardware!? I think we'd better not get stuff else we'll end up like the loser IBM users I have to deal with on a daily basis on local BBSes!

>then just copy d2: to d1: and your done.

But if you have a lot of files to transfer, it gets tedious to restart
XF2 for every file (or 7) to copy to the disk image. It might help to
ARC everything together first, if you have ARC for the PC.

>BTW SuperUn/Arc scrunch and Dskcomm all work great under PC-Xformer...jut
>be sure your setup a blank disk immage using the sio2pc software first.

Now we need a PC program to convert DCM files directly into SIO2PC/XF2
disk images. Any volunteers?
(I converted FTESD32F.DCM to a SIO2PC disk image -- before I
remembered that it needs an XL -- but it took about 6 more steps than
it should.)

...[more deletions]...

While you do have a point, I think the amount of discussion
that has gone on concerning XF2 in c.s.a.8 tends to undermine
the relevance issue.

An 8-bit operating system (Atari or otherwise) running under
DOS is >still< an 8-bit operating system.
That XF2 happens to be the 400/800 OS, then it belongs here
just as much as SIO2PC does.

With SIO2PC and XF2 both using nearly identical disk images,
and many people using SIO2PC in conjunction with their Atari,
it seems logical (to me at least) that using XF2 as an "aid"
or "tool" to facilitate actual, physical Atari hardware to
be relevant here in this newsgroup. As one poster here put it,
XF2 will be used as a development tool via a laptop PC, replacing
pencil and paper. Without any Atari hardware equivalent, this
is a brilliant idea.

XF2 will no doubt (IMO) make some improvement in the amount
of Atari 8-bit related products that will make their way to
the users or c.s.a.8. With PC Xformer 3.0 in the offing, I
can see how helpful it will be in using a PC to download
Atari software from the Atari archives on the internet,
run it in the emulator, and decide if it is worthy or useful
enough to bother with tranferring it to an Atari disk.
It will save some people (like me) a lot of time.

If a PC can make my use of an Atari more productive, then
that is all the relevance I need.

But that's just me. Others can disagree, but I welcome
the XF2 software wholeheartedly for the above reasons.

If its only purpose was for PC users to be able to play
their old Atari games on, then I wouldn't take this position.
But that's not how I plan to use it.

Am I alone on that? Hopefully, not.

>Perhaps the site could contain full disk images of these files...

Don't forget, you need either SIO2PC or one of the Xformers to be able to read those disk images. That means that unless sombody writes an Atari utility to extract those disk images (sorta like Diskcomm), those full disk images are wasted for people still using real Ataris with no PC attached. ("Huh? You mean there are still a few of those people around here?" :-)

I'd be happy with a program on the PC to convert a batch of them at once, without loading up XF2 until they're all converted and ready to run.

I would love to take a stab at it, but I have 2 or 3 other projects I put aside a few months ago, foolishly thinking I'd have more time to work on them now. (I had more time then.) I'd be interested in looking at the ATR and DCM file formats, but I couldn't guarantee any results.

I don't know, but I noticed something interesting when running
SWANDEMO on a 486sx-25 and a 1200XL side by side.
Most of the program (spinning fuji, flying bird, spinning words) was
about twice as fast on the 486, but the rolling colors (made with DLIs
& VBIs?) on the fuji seemed a little faster on the XL.

I think the majority of 8-bit Atari participants in c.s.a.8
have a wide range of Atari 8 related interests. And that it
becomes difficult to determine appropriate topic matter by
hardware alone. I like to hear from people that use other
hardware, and are able to compare the other hardware to
Atari 8 software and/or hardware. I really think M.Current's
admonition should be taken as a 'hint' to to make c.s.a.8
posts relevant to the 8-bit topic and avoid going into great
detail about the inner workings of PCXF2. I hope it doesn't
become necessary to prohibit Atari 8-bit emulator discussion
entirely. I am happy that c.s.a.8 doesn't get much of the
'The world is coming to an end' and hare krisna and gay
rights and other totally off topic stuff. (Hey, can anyone
delete someone else's messages?)
(I am getting a little tired of pcxf2 'details.')

>to banish any of them to an outside newsgroup.

PC Xformer has reawakened my interest in the 8-bits, because it allows
me to use the Atari software without fooling around with floppies as
much. Before I downloaded XF2, it had been months since I last booted
up the Atari, and even that was only because someone else was using
the 486. Now, once I have the software converted to ATR disk images,
I can go directly from whatever I'm doing on the 486 (usually
something the Atari can't do) to something on the Atari, via XF2.

Why discourage this thing that can only encourage more people to use
-- and WRITE -- Atari software?
Think of XF2 as a new model of Atari 8-bit computer, with its own
compatibility problems, just as all the others have their own
compatibility problems.

>> Please post followup opinions, if you have any. If there are no serious

Count this as a serious objection. As I see it, this newsgroup is for discussion of matters related to Atari 8-bits. XF2 is closely related to the Atari 8-bits; the only thing it lacks is the same underlying hardware.
I could just as easily object to the discussion here a while back about the 65802/65816 processors, which are (were?) only related to the Atari because of Chuck Steinman's Turbo816 board, which (in its native mode) did not run any Atari software except for the 1 or 2 programs specifically written for it. I think that discussion was appropriate here, and the XF2 discussion is no less appropriate -- at least XF2 runs existing software.

From: romer@access1.digex.net
Message-ID: <2vd8vr$f0e@news1.digex.net>
Source record: 100079

Just a couple of things...

I still can't get my 14.4k modem to work properly with my 800/850 setup. So, I've taken to d/ling some stuff from umich on the IBM to try to use one of the various disk utilities to copy them over. HOWEVER...

I have an Indus I got from some kind person here on the 'net. I can't get it to format a DD disk (at least, a disk MARKED DD on the label)... I also can't get UTIL to do it (I get an error about sector 0)... admittedly, the disks I have are old, but can anyone tell me what I need to get off umich (including IBM archivers other than PKZIP 2.04) to be able to transfer Atari files off my IBM to my 800? <whew!>

And, to toss in my 2 cents, keep the XF2 discussions here... i hate digging through a bunch of newsgroups to find what I want to talk/read about, and there's not that much traffic here otherwise...

>
> What is the position of 8 bit software in terms of
>copyright now?

On a related issue, what is the status of the Atari 8-bit OS and BASIC?
Darek for the xf2 emulator says that he is using both with permission, did he
get a private deal? or has it generally been released so that anyone can
use these for their own purposes?

I think the fact that he makes it very clear that he did get permission, is
a good sign, that you do need just that to reproduce software even if the
platform is no longer produced [as several others have already said :)]

> files to SIO2PC! It's not because I'm so LAZY as to load up
> the DCM and then rewrite it to an ATR file, it's just it
> doesn't always work right! (The ever present ERROR 139).

What do you mean? Run Diskcomm under XF2, no errors.

> Why can't XF2 do disk images above 80 / 88k ??

It can. Just have SIO2PC make a big image and format
it under XF2.

But here's the catch. XF2 doesn't support the ATR format quite
right on double-density (the author is aware of this).

See, the first 3 sectors of all Atari disks contain only
128 bytes each... SD, ED, DD no matter. SIO2PC therefore puts
the boot sectors together.

XF2, when used with DD images, expects 256 byte boot sectors.
This throws off all reads to the DD disk image. (that's why
the directory is blank.)

What does it mean to you? You can use double-density with XF2,
but SIO2PC won't work with XF2's DD images or vice-versa.

How about a large _single-density_ image? This limits you to
8-megs, is that enough? Should be compatible with both programs.

I agree that we're getting overrun with XF2 posts.
If there is a core group of people who are exclusively discussing this topic, perhaps you should move the discussion off the USENET and into the e-mail region?

While Michael Current's comments ring true for me, philosophically, I also agree that since XF2 allows the Atari 800/400 OS to run on a PC, then discussing XF2 in c.s.a.8 IS justifiable to some extent.
On the other hand, If I were running SoftPC on a NeXT machine and couldn't get Lotus 1-2-3 to run, would I discuss my problem in a IBM PC group devoted to LOTUS stuff, or in a NeXt discussion group?

[grumble] I'm getting confused here... time to go back to bed.
I hope you guys come to some sort of amiable conclusion.. as long as we no longer get overloaded with XF2 stuff.. it seems all that gets posted here these days.

Rob Funk was complaining about moving files one at a time to the XF2..

Yeah, I can understand that from using SIO2PC (at least I've got two computers running.. I think XF2 needs some MSDOS options like Shelling to DOS, doing MSDOS directories and adding new disk/file images to the thing) .. BUT!!

Just go get the file "S2PC.ARC" from the Utilities (or was it Applications?) directory on the Atari archives at UMICH and you'll be able to d a LOT of MyDOS stuff to MyDOS .ATR files (which are the SIO2PC style disk images which XF2 allows)!! Cool, huh!? Moving files from disk image to PC and from PC to disk image, deleting files within disk images, changing MyDOS directories in the disk image and a few other things are all allowed! And it's from a MENU even! Cool!

I didn't hear of it (I THINK!) until the other day. It should be noted in the dox to both SIO2PC and XF2 in my opinion!

Try it out.. it's ARC'd (dunno why really, I thot ZIP was the 'official PC compression'! hehehehehe.. also, it lets you determine XL/XE programs from PC programs (XF2, SIO2PC, etc) on the UMich archives :)) and comes with docs (which of course I didn't totally read like I should :))

Oh yeah, not only is it menu-controlled, but it can also do a ton of stuff all from command line! yay!

(try making an MSDOS .BATch file that accepts parameters (via "%1","%2",etc) and can let you add a ton of files to certain ATRs at once, cool :))

Source record: 100086

Uh oh! Rob Funk again, eh!?

Rob was saying he didn't boot his Atari except once for a long time because of floppies... I've got three words for ya!!!

```
Get an SIO2PC
--- -- ------
1 2 3
```

:)

They're WONDERFUL! File your disks away within MSDOS directories (or on your Mac with RS232 ports and SoftAT or SoftWindows <- what I'd love to try :)) If you can get DCM's into ATR's ok, you'll even be able to put boot games and demos and a wide range of DOSes on your PC to play with!

3606. Err... coldstart switch

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-06 07:18:37 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940706001851.23802265@sonoma.edu>
Source record: 100087

I was wondering.. often I have trouble rebooting Action! correctly when it crashes (ie, using Control-F4 which is my coldstart switch on my 1200xl) and I've also had trouble with other programs as well which just DON'T want to reboot without losing power..

Anyways, I know people have coldstart switches for their Atari's (either as hard-wired things or simple OS changes like mine) but I'm wondering if they're really needed all that much!!!? Now, I know removing carts while the power is on is supposedly "bad!" for your computer, but I've NEVER had ANY trouble with it! All I do is hold [Reset], yank the thing out, release [Reset] long enough for it to start rebooting w/o the cart. (Action! in most cases), then hit and hold [Reset] interrupting that boot, plug the cart. in, then release [Reset] and boot and then get back to work.

Ok, 1) is this really all that bad to do?
2) would this work in pretty much every case that coldstart switches do? (ie making them redundant :) and cheapening systems)
3) do 130xe's have coldstart switches? (them being the only system w/ extra RAM >stock<)

Thanx!

From: KENDRICK@sonoma.edu
Message-ID: <940706003500.23802265@sonoma.edu>
Source record: 100088

Jeff (L.), no no no no no ! :)

I haven't tried DiskComm with XF2 because I only played with it for like a half an hour. It's getting DiskComm and MyDOS to accept what type of 'disks' or 'drives' the SIO2PC fileserver software has set up. ie, if I tell MyDOS to look at either SIO2PC's 140k drive or even my 1050 (and then turn it off and replace it with the 140k SIO2PC disk/drive) and then have DiskComm format it and write to it, it dies at the first sector with an error 139! SOMETIMES! I often have to just format a disk on the 1050 and even write the .DCM to it with DiskComm, then do the exact same thing AGAIN (write the .DCM to D1:) but this time with the 1050 off and a 140k file on the SIO2PC. People have said that forcing the disk image on the SIO2PC to be a physical (not RAM) access helps, but you don't HAVE to do it that way!

It's all too weird. I still think we need a .DCM -> .ATR converter (and maybe an .XFD -> .ATR converter.. maybe one that'll fix up the ATR/XFD DoubleDen problem you(?) mentioned...)

ANyways
thanx for the reply tho

Message-ID: <1994Jul6.081916.16063@ericsson.se>
Source record: 100089

This copyright discussion has been gone through a thousand times on the Sinclair and Commodore newsgroups. As a result of these discussions, FTP sites have been started and filled. The fact remains that at the moment there is no clear or international law around this. The copyright does hold, but with many companies gone, who do you buy the copyright off? There is no timeout on software copyright either. If you try to contact the remaining software houses, they either don't answer or shrug their shoulders. If too many people hassle them, they start to believe that there really is a market for the old stuff, and start trying to sell it again.

I guess it's down to conscience. If you feel happy with software of questionable legality, then start an FTP site. Some PD and shareware stuff can go on it anyway... much the same as it already does with the Atari Archive. Personally, as a software author, I don't feel able to upload to to such places, but it's down to the person.

Zargwog...

Message-ID: <5SMsVcmmS7B@antic.sub.org>
Source record: 100090

Hi!

I'll post a small programme to UMICH on Saturday. It'll allow people to convert disk images on the 8bit to a single file. Since the XFD-format is the uncoded equivalent of a disk in single density, that programme will, of course, not encode anything either. Although that'll make files quite long (92160 bytes), it is probably the easiest method in this case. Once a file is converted to the XFD-format, you have to copy it to a disk in double density and transfer it to the 8bit via using ATARIDISK (or maybe MULE). If ATARIDSK is not on UMICH yet, I'll post it in Saturday as well. Fair enough?

Zargwog, why don't you upload your software to the UMICH archive? Or am I taking this comment the wrong way?:

"Personally, as a software author, I don't feel able to upload to such places, but it's down to the person"

Do you mean you wouldn't upload (c)'d wares to UMICH, if so, that's understandable (and praisable), but if you DO mean you don't put your software on UMICH, please explain why!?!

It's one of the most accessable huge 8-bit file areas around! (Or is it!? I don't have GE:nie, and CIS's stuff has been added to UMICH, and I don't have any OTHER online service other than local/sub-local bulletin boards, so I really can't compared from experience, but in most cases, FTP'ing is one of the cheapest ways to get mass amounts of files!)

3612. Re: 8-bit Atari Emulator discussion

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-06 09:22:16 UTC
From: jon@computer-science.paisley.ac.uk
Message-ID: <18058.9407061023@chaos.cs.paisley.ac.uk>
Source record: 100093

Right... okay, can we be reasonable here !!
I have both an 8-bit Atari and a PC, and I'm happy with both. Okay so the 8-bit is getting a bit over the hill now, but I still love it and have the fondest memories with it.
The problem seems to have occurred with the release of XF2 only a couple of weeks ago, and what happens when something new gets released, well there's a LOT of posts about it !! Now, I don't see anybodyt complaining about SIO2PC and I guess at the start thats what everybody wanted to talk about, but as things get older the discussion gets less (look at the Falcon 3 mailing list for a good example). So why don't we all sit tight for a month or so and see if this emulation discussion tails off a good bit and if there's no indication of it slowing then sure if all you 8-bit only owners want it to go somewhere else it'll go !!
The complaints seem to be that there's too much talk on emulation, well IMHO there isn't too much talk about anything in this conference the 8-bit conf has a few posts a day normally. I'd understand a great deal if this was the DOOM newsgroup and somebody kept prattling on about the Atari Jaguar (the DOOM newsgroup is very busy) but unless you pay for usenet access (I sympathise) then I honestly can't see what all the anger is about !
And if any of you are using a usenet feed to mail-list then I can appreciate how annoyed you are about the 8-bit emulation discussion but this is a newsgroup.
Maybe with the upcoming release of version 3 of the emulator we might see a new lease of life for the "classic" ataris (look at the sinclair spectrum emulator) and maybe certain German software writers might start developing games and applications on the PC emulator (far easier than on an 8-bit, but w with possible emulation probs maybe)...

But these are just maybes and if the moral majority want emulation talk or talk of hooking up atari devices to an emulator banned from this discussion list, then so be it. But let's not have a knee-jerk reaction now, give things time to settle down, wait and see then act. As for the comp.sys.atari.8bit.emulation area, well that's a dead-duck, maybe a comp.sys.atari.emulation similar to the amiga section. After all there's already a lot of emulators for the atari family (stxf, (pc)xf2 and spectrum emulators).

Regards,
John
(P.S. Still looking for a Transformer cable or serial cable for 8-bit)

References: <2vc66j$jqu@usenet.INS.CWRU.Edu>
From: bob.lange@aquila.com
Subject: 8-BIT ATARI EMULATOR DISC
Newsgroups: [merge me!]
Organization: Aquila BBS, Aurora, Illinois

In the referenced article, on 07/06/94, MICHAEL CURRENT writes:

MC> comp.sys.atari.8bit is for discussion of Atari 400/800/XL/XE
MC> hardware and software. XF2 (PC Xformer) is not among these, it is a
MC> DOS application.

I disagree with this statement for the following reasons:

<*> By segregating the 8bit emulator users from the general 8bit community you diminish the pool of available 8bit information. Now is not the time to isolate _any_ Atari users, as the pool is too small to begin with.

<*> If I'm using Atari BASIC or Lightspeed C to write something new for the Atari community and have a general question, my platform is unimportant to the discussion. Unless you want me to write it specifically for emulator users. I doubt that you really want to tell people like FTe that their support of XF2 is unwanted.

<*> As more and more Atari 400/800/XL/XE computers bite the dust, one should know that there is a way to continue computing Atari style without having to do an exhaustive search of Usenet. BTW, while I'm thinking of it, GEnie has set up a special XF2 support conference in the Atari 8bit area.

<*> Very few sites carry the comp.emulators.misc newsgroup. You're basically telling us to get off the net! I've run into this before, and it resulted in fracturing of the former newsgroup community. Some people went away, some went to the other newsgroup, if they could get it, some stayed and lurked, some stayed and protested. No one benefited, except a few of the purists who sat back and watched with some degree of satisfaction.

<*> Making us go to comp.emulators.misc and hunker down with former Commie users is akin to just what you're complaining about!

<*> I have both working Atari computers (an 800, a 1200XL and a 130XE) _and_ use the XF2 emulator. What camp do I fall into? Where do I get support on Usenet?

<*> Regardless of your attitude, the future of Atari 8bit computing is emulation. Face it, no new hardware is coming from Atari. Sooner or later, the last one will croak, and then they will just be a memory.

Are you sure this file isn't atarimg in /atari/8bit/Sio2pc? I found atarimg
in that directory and it will copy multiple files to a MyDOS format archive.

Is there a utility that will copy to SpartaDOS or AtariDOS, I don't know if
Sparta will understand MyDOS, or will MyDOS understand Sparta? One of them
has to be able to read/write the disk format of the other so I can copy the
files to different formats, and what is the deal with XCOPY not supporting
enhanced Atari format diskettes? That is really driving me nuts. Is there
something I am forgetting?

Unfortunately no :(PC Ditto only emulates CGA graphics, and only
emulates an 8 bit PC, XF2 requires VGA and at least an AT (16 bit)
PC.
Of course you realize that even if it did work, it would (in my
estimation) run about 1/10 or slower that an original Atari 8-bit

BTW, This is off the topic slightly, but I have been able to run
the magic sac emulator on the Atari ST emulator running on my
PC. (PC-DITTO wouldn't work on the emulated ST though)

I dont mind the ATARI SPECIFIC talk about the XF2. BUT, what I DO
MIND is all the senseless messages about:
How do I get files in XF2 format, How do I get files in SIO2PC format,
How do I disable basic in XF2, How come XF2 wont run on my IBM system,
How come this game <insert_name_here> wont run on XF2, Can someone make
an Undiskcom for the IBM. . . <etc> . . .
Almost ALL of those questions dont have a damn thing to do with the
Atari 8bit!
If you wouldnt be asking the question if you were using a real Atari
8bit, then dont post the message in this Newsgroup - post it in the
group created for Emulators.

Thank you,
BRiTiSH

Good point. Except -- this message was
crossposted to comp.emulators.misc...

If enough traffic exists concerning Atari 8-bit emulation, perhaps
a newsgroup comp.emulators.atari would be a good idea? There are
already such newsgroups for Apple // and CBM...

And then it would be *clear* where the Atari 8-bit emulator messages
should be posted.

In theory, I agree with you. Trouble is, I have to have my MS-DOS machine set up and it takes all of my available space. I have not had my Atari set up for about 2 years now although I still consider myself an Atari 8bit supporter.

So I have said for over a year now that a good 8bit emulator that runs on an MS-DOS machine is exactly what I need to use my 8bit software again. I have been waiting for Darek to release his emulator for a long time and I can't wait to try it. I haven't had a chance yet, but I am trying to get a copy.

It still won't help my Atari hardware, but look at it this way. I am archiving the original and using a copy! I thing an emulator is only truely useful if it does PM graphics, sound and collision detection. So I hope that Darek finishes the job he has started and dosen't drop it in the middle like he has some other projects.

I have a coldstart switch wired into my 256K 800XL. It's _extremely_
useful, especially considering that I often download into RAM-disk and
restore the files to floppy afterwards. On the (rare) occasion that the
computer locks on me, it's terribly convenient to coldstart the computer
without wiping out my RAM disk.

So all we need is a "low profile" site with a sysadmin who has the
guts to pull it off. BTW, the Spectrum folks are still waiting for
all those lawsuits :-)

I believe Syncalc is in the process of being released into the PD.
Someone came by a while back and said something like that (claiming to
have been from Synapse). I replied saying it would be about time we got
our hands on the source code and updated it for modern storage media and
more bankd RAM. But like many things 8-bit, it's in a limbo right now.

: computer locks on me, it's terribly convenient to coldstart the computer
: without wiping out my RAM disk.

The US+ OS, the MUX OS, and the Black Box impose a cold start using help and reset. If anyone has or is gonna get that hardware a cold start switch is redundant.

And that also proves that you don't need to do a hardware hack to get a coldstart without powering down!

Subject: #175 mystery controller

In digest#175 cohen needed to ID a light gun.

I think I can identify the light gun, I also have one. I bought it new in
the late 70's. It came with the Telestar Marksman game console by Coleco in
Amsterdam, New York.

The Telestar had either a gun or a rifle which broke down into a gun
(removeable extra barrel and military style stock),two stationary control
knobs to serve as paddle controllers and a plug on the console top face for
the guns 5 din connecter. It had built in tennis,hockey, jai alai, target and
skeet. The ball or target was always the same white square. I still have
all the documentation for it. It ran on batteries and connected by switch
box to a TV.
Hope this helps. Gale Putt (pooskie@aol.com)

I want to! It would make Atari life much easier.

For one thing, unlike XF2, SIO2PC would let me print Atari stuff
without moving my printer cable. Now if only I could redirect R: to
the PC's internal 14.4k modem instead of my external 2400......

I have played with the program a little, but I haven't had the time to
make the interface yet.
I also need to clear some space on my hard drive -- I have less than
8Mb free on a 212Mb drive. With all the downloading I do (I'm spoiled
by 14.4k SLIP), I don't think I can put all the Atari disks on the
hard drive yet.

Sparta sometimes knows MyDos, depending on your version of Sparta and
which commands you use. SDX does it most transparently.

You forgot to get a U.S. Doubler for your 1050 back when they were
still commonly available. :-)
Considering everything that doesn't like enhanced density, I feel
lucky to have 2 Doubled 1050s. Maybe some future release of Sparta
from FTE will support enhanced density.

That's always been my method for coldbooting the 1200xl, especially
when I can't tell SpartaDOS to do it. I don't even think you need to
release RESET for that second after pulling the cartridge.

Probably some Cold Reset switches do the same thing as pulling the
cartridge, but more elegantly.

The question of whether it's bad for the computer was addressed in the
ANALOG article about their translator (which would translate for
cartridges). The author said that if it were bad for the computer,
Atari wouldn't have made it so easy on the XLs to change carts with
the power on. These things were designed to be used by people who
don't read directions!

:

ace of america

503-285-4417

Sysop= The Shadow
aka David Hunt

Status: undergoing SLOOOOOWWWW but major rewrite for Carina 3.

Current version: 2.7 I think it is called.

Net status: Poor. Some have bowed out. Terry Ortman terrorizes the
net with his posts which go unregulated.

Software evaluation: Potential for a GREAT board but archaic code holds
it back. There is nothing wrong with using a Basic core as long as you
load up the file transfers and other speed intensive stuff with embedded
and OMPTIMIZED M/L. Carina therefore does not run as far as PRO!,
nowhere NEAR it. I have yet to hear of reliably 9600 even though Shadow
supposedly released a 19.2k ready core. The protocols max out around
4800 and are not as robust as PRO!'s. In other words, the look and
functionality is very good, but the efficiency is nil and it requires a
total rewrite IMO.

I like many of the features of Carina. But its inability to keep up with
faster modems is by far its main disadvantage.

For those wanting an easy to modify board, I'd rather suggest Forem which
supports 9600 reliably. I used to run Carina and it is with great
sadness that I now feel this way.

Forem runs on Basic XE. Carina is AtarBasic and Can run on Basic XL as well.

Or BXE without extensions.

Forem also has advantages because it is FREE and it is crossnetted into PRO!.

The problem with Forem is that navigation is a little clunkier than
Carina and PRO! and I do not find it that easy to set up, but with some
personal help it isn't that tough I guess.

Forem opts for a few HUGE modules rather than the many tiny modules of PRO! or the several medium sized modules of Carina.

It is in the realm of sysop BBS maintenance and editing modules that Forem is weakest and Carina is by far the easiest.

Of all three, Carina is the easiest to set up and run, but I had problems with its spaghetti code causing impossible to diagnose lockups. Part of this is the rather tenuous coexistence of an ML core and the basic modules, and all the tricks involved with memory management, registers all over the place, and the ML core installing various interrupts. Basic wasn't really designed for modular code and it is a tricky thing to do and make it stable. For instance, error trapping is obviously an issue since you don't want a user to fall into Basic. So the ML core "watches" over the program to some extent and again, this can cause problems.

Pro! will not lockup unless it is a hardware induced one from my experience.

I realise that it would be Illegal to upload old 8-bit software,
but lets face it - just who is going to complain? Most of the
software houses that made the stuff no longer exist and those
that do can't even remember the 8 bit.

Unless there is someone out there still making a living out of
selling the software, I can't see any moral arguments against
making it freely available. I really enjoy being able to run
spectrum software on my emulator - availablility of Atari classics
would definately boost interest in the 8 bit.

3641. Online DE_RE Atari? Keeping 8bit Alive!

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-07 10:11:17 UTC
From: moran@bnr.ca
Message-ID: <2vgkc5$crc@bmerha64.bnr.ca>
Source record: 99972
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.advocacy

Following on from the theme of putting old 8-bit
commercial software onto an archive in the interests
of keeping the 8 bit scene alive, how about someone
translating the old reference manuals such as
'De-Re Atari and 'Technical Reference Notes' into ASCII
or postscript files (with maybe a seperate GIF archive for
diagrams etc.) and putting them online for FTPing????

I REALLY believe that the only way of keeping the 8-bit
scene alive is through....

(a) Increased availability of emulators for modern machines

(b) General availability of all the old software for
FTP downloading.

(c) As much on-line documentation as possible, including
all the old reference manuals in computer readable
form.

Just imagine classics like MULE, RESCUE ON FRACTALUS and BALLBLAZER
were available in an archive package with an XL emulator for
PC/Amiga/Falcon whatever. Those old 8bit games are excellent, and
there are dozens more. Theres a lot of people in the Amiga group
crying out for classic 8 bit conversions - imagine you could get
your hands on them in an emulator package. It would be a real
hit with thousands, maybe tens of thousands of new users running
an Atari 8-bit (albeit via emulation) to play classic old 8-bit
software. Show them a few demos and throw in the text of De-Re
Atari into the emulator LHA file and you WILL attract fresh
interest and tempt old users back...

OK, i realise that translating the manuals into text will
be time consuming, but this is the age of OCR. Shit, we've
even got a scanner and OCR software where I work so I'm
willing to try the viability of the idea!!!

If my sysadmin agrees with it, I'm willing to create a directory in my own
FTP dir at our local site for atari 8bit games that run on the XF2 emulator,
but under 1 condition : all uploads have to be accompagnied by a README file
or something which specifies the uploader so when there are troubles concerning
copyrights, the actual guy/girl who broke the copyright can be hunted after.
This also implies that I won't put (pirated) software in this dir myself,
but that I'm merely somebody who puts all programs together in one place.
What do you all think of this? Bad idea?

I too have an IBM compatible, but it sits idle next to my massive 8bit setup. Having a choice, I'd much rather use the real thing, than emulate at reduced speed.

Just seems kinda funky to get 40 column video on a 1024*1024 monitor.

Could anyone help me?

I vaguely remember a game for the 8 bit Atari which reminds me of Fire and Ice on the ST (I've never actually seen Fire and Ice working though!) The game was set in Arctic conditions and your character was, I think, a penguin. It was a game in which you had to jump over obstacles and it was rather good.

Does this ring any bells?

Also, I've been reading what people have said on XF2 and although most of it is too technical there is one point I'ld like to raise. Someone said that XF2 should be thought of as just another Atari 8 bit with its own compatibility problems. Perhaps the next version of XF2 (the one that is supposed to emulate the XL/XE) will be thought of in this way. Trouble is, the current version doesn't have P/M graphics collision detection and to be honest the quality of the P/M graphics don't compare too well to the real thing - it could be the minitor I'm using. This is a bit like owning a toothless guard dog that doesn't bark.

Copying cartridges to disk or tape:

there was a device available a few years back which promised to copy every cartridge to disk (or tape). I saw Donkey Kong and Quix copied to disk in this way an both games worked. I can't remember what this device was called but I think it was part hardware. As there has been some talk about throwing caution to the wind and making old Atari software *which is no longer available* accessible through FTP sites I would like to ask - could this be done for cartridges? I hope it could. Basically, to obey the law in this case is bloody stupid:
I had a copy of F15 Strike Eagle for the 8 bit on tape. A couple of years ago the tape became damaged so I sent the tape back to the UK distributors (US GOLD). Eventually they replied to me and said that the game was no longer available for the Atari 8 bit and they could no longer replace it ('of course', I offered to pay).

Finally, does anyone have a copy of Pooyan that they would be willing to sell?

Gareth Davies.

Message-ID: <5SR71k8XS7B@antic.sub.org>
Source record: 99978

Hi!

I'll post a small programme to UMICH on Saturday. It'll allow people to convert disk images on the 8bit to a single file. Since the XFD-format is the uncoded equivalent of a disk in single density, that programme will, of course, not encode anything either. Although that'll make files quite long (92160 bytes), it is probably the easiest method in this case. Once a file is converted to the XFD-format, you have to copy it to a disk in double density and transfer it to the 8bit via using ATARIDISK (or maybe MULE). If ATARIDSK is not on UMICH yet, I'll post it in Saturday as well. Fair enough?

Well, that's great if it really exists, but for some reason it's not here at my site (ultb.isc.rit.edu) even though we seem to have everything else in the world. Does this group actually exist where you are? All we have are the amiga and apple emulator groups. (maybe a separate Atari one should be created-- if it was, I'd agree that the conversation goes there, but posting it exclusively to just comp.emulators.misc (if it exists) will cause it to be missed my many Atari folk who are interested, such as myself)

Yep, I remember this game. It was by DataSoft and was available
around the same time as Pooyan. It was a left to right flick screen
scroller where you moved a penguin over platforms and obstacles.
Can't remember the name though, but it was available on both the
C64 and Atari 8 bit.

> software *which is no longer available* accessible through FTP sites
> I would like to ask - could this be done for cartridges? I hope it
> could. Basically, to obey the law in this case is bloody stupid:

I agree. It's stupid to obey the law and not make available old games
for which there's no longer any market anyway. It's most unlikely that
anyone would take legal action, unless they were just looking for a
quick buck.

I saw the device for copying carts too. It involved some sort of
dummy cart which fooled the computer into thinking a cartridge was
present. You needed it present when running the games

HOWEVER

I also have copies of cart games in my disk collection and
looking through some of these it seems that they have been
cracked - in this case they seem to have been dis-assembled
and then reassembled with the ORG address set lower - right
around 16K to 32K rather than 40-48 or 32-48 as they would
originally have been. Some were even located as low as 4K.
Many of them are Binary files that can be loaded via DOS ,
most that arent can be loaded via Spartados in a minimal

memory config.

Given that the code was typically 8K max, cracking
and reassembling the code shouldnt be too difficult.

Way back when I didn't know about the US Doubler, actually, I think, it came out after I dropped out of the Atari. As for XCOPY, maybe I can hack a copy for myself or write my own XCOPY program, but Atari's way of using input and output is kinda kludged. I tried to output a line of text or even a single stinking character to the screen, well needless to say all I got was 0, zip, nada. I got a 1 sector program that would take up space, guess I got something from it.

I'm looking for two classic Atari games. The first is Return of Heracles, which was made by the same guy who made Ali Baba and the 40 Thieves. The second title I believe was called Zombies. You could play alone or two together, and I remember the purpose was to move your tiny character around from screen to screen collecting items while avoiding the bad guys. If one guy died, the other could resurrect him by touching him, hence transfering energy to him. If anyone has either one of these and is looking to sell them, let me know. Thanks!

Kind of like those talk shows that purport to be about
the wonderful new technologies that are arising in the
digital field, only to spend 95 percent of their time
dwelling upon virtual sex?

The XF2 stuff will die down eventually.
Right now, it's a new "toy" (no flames - please!) and
the resulting hubbub is to be expected.

Message-ID: <01HEFGRC1PSI8WYXJN@vax.edinboro.edu>
Source record: 99985

I am trying to write a program so I can connect a dumb terminal (a VT320) to R2: of my 850 and still leave a modem connected to R1:. I want to do this so I can have a very good 80 or 132 col. display, but still direct download files to the Atari.

I am also experementing with the idea of using the VT320 as a terminal to the Atari (well... anything that uses the E:,S:, or K: drivers).

What I want to do is send all E:,S: and K: data to R2: and send all R2: data to either E: or K:

I'm not sure what the best configuration would be. I'm not sure if I have to use K: and S: or K: and E: or even just E:

Does anyone have any ideas about this or how to do it????

Thanks...

-Adam Conover.

Because even off an 850 (9600 limit) he'll potentially get more throutput out of this type of hack than an XEP.

This may all be moot because I'm beta testing another Flick version and so far so good. The earlier one didn't run on my version of MYDOS 4.50 for some reason, but this one has all the enhancements I asked for as well as blinkers and brights. Still have to test blinkers and brights, but so far no apparent bugs.

I have a user-group meeting next week where I will demonstrate this and Clay knows that deadline so he told me if this version gets the seal of approval then I'll upload it to the archive.

Diskbase allows for the most storage but really is only usable on a hard drive or ramdisk. But I swear by it. Porting database data is easy because you can print to a diskfile and most IBM database programs worth a lick can be made to absorb simple text files into their own format.

Decided to hook up my PR:C again (have two MIO's) and ran into the same old problem I've always had with this device.

I have a Hayes Ultra 144 Smartmodem.

Using Bobterm, I select a 9600baud Atari BBS to call, hit Enter upon that entry and whamo - the modem tries to grab carrier, but cant. I have to repeat this process about 10 times until the modem finally dials out. Using an 850 or MIO with same modem/hardware works flawlessly.

Why does the PR:C do this? Whats the problem!?

Any help appreciated.

Great games, both of 'em. Zombies was actually an early version of "Realm
of Impossibility" (Electronic Arts bought the rights to the program,
changed the graphics a touch, and added a bunch of new levels). I have
Return of Heracles (as well as Zombies and R-O-A; not for sale, though)
but the game crashes when you get to the Sphinx. *shrug*

Sorry for rambling. That just brought back some memories. :)

I got this guy bugging the hell out of me to get him Bobterm. Thing is, he onlyhas an XM301 modem. Where do I get an R: driver for this cheap *ss modem?

I wish he would spring for a fast modem, at least the Atari 1200 baud with the built in SIO port.

I looked on a.a.u.e for the driver, but since none of the files have descriptions, it makes it hard to find anything. I like how the ST secrtion is organized, with about 90% of the files have a descrion in the Index file.

Maybe someone could do that for the Atari archives.

Back to the original reason I'm posting this. If anyone has the R: driver for the XM301, please mail me info on how to get it.

Thanks

eric.palm@drs.state.ct.us

I have one simple objection about the dicussion of Atari emulators.

From my experience, the great majority of interest in emulators for older computers is from people who have "I own a PC/Mac/Amiga and think it is great and I don't care about the C64/Atari/Spectrum/Apple II but they have lots of awesome games that I would love to be able to snag from an ftp site and play on my machine" written between the lines of their postings.

Any incoherence or overgeneralization can be attributed to recent exposure to a Nintendo commercial that proclaimed "Give the World A Wedgie."

3668. SYQUEST HD MECH

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-08 05:43:46 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407080543.AA196146196@relay2.geis.com>
Source record: 99999

SyQuest Mech

I have a spare SyQuest-44 mech to sell, $90 including shipping.
Unit is brand-new, never used. USA buyers only. Money order preferred.
Manual included. Cream-colored face (very close to 800XL color).

This is the bare mech only. You're on your own for a case & power supply.

I can also sell one magnetic cartridge to go with the drive, $45 including
shipping. I won't sell the cart separately, I only offer it as an additional
option to go with the mech. Cart comes with special shelf case & manual.
Carts have a little red thingie you turn to write-lock the cart, just like
the write-protect notch on a floppy disk. The carts are the same size as
a 5.25" floppy disk, only they're about 1/2-inch thick.

SOME INFO: this is a 44-meg removable media hard drive, 5.25" HH form factor.
It uses a standard SCSI interface. Unlike some Seagate & Quantum SCSI mechs
I've encountered, SCSI implementation in these SyQuests is very robust. I
began using one on my 8-bit with a Black Box several years ago & haven't
experienced a single failure despite heavy use. I've low-leveled all my 8-bit
carts with the BB so they contain 3 partitions of about 14-megs each. I'm
rather wasteful in my low-level formatting, as I allow several hundred sectors
between partitions as a "guard band" so a catastrophe in one partition won't
spill over to another. I also installed a SyQuest 44 mech in a
ratty old 286/12 with a ProCom Tech host adapter & it performs flawlessly.
If that nitpicker Alchemist can't find anything in these drives to complain
about, you can figure it's a decent product.

Extra carts are available locally or thru ads in mags like Computer Shopper.
Local stores in my area offer them for $85, which is ridiculous. Mailorder
prices are around $60, which is decent.

The 44-meg SyQuests are NOT like the earlier models, in that there are no
restrictions on how often you can remove/replace the cart. They really
improved that, I treat them as giant floppies. The great advantage of
removable media over fixed drives is that if the drive dies, at least you
don't lose your data. I keep a few spare carts around to backup all my data,
I never have to mess with floppy backups or streaming tape or any of that
crap. If you also keep a spare mech (as I still do), then your setup is
totally bullet-proof, you're immune to all disasters (excepting possibly
a direct hit by a 20-megaton warhead).

Interested parties, contact Ben Poehland at: b.poehland@genie.geis.com

Any comments on SyQuests or hard drives in general, please post to the
newsgroup, not to me. I'm getting 60K of email a day, it's driving me batty.

XF2: Another View

I cast my vote with those who say this emulator stuff has gone too far in this group. I, too, would like to see a return to the "normal" chatter (whatever that was!).

Of course, if the majority of participants in this group feel strongly that XF2 is such a big deal, then eventually us "grumblers" will get fed up & just quit reading the Digest (or CSA8 or whatever).

And if that happens, well it probably won't matter anyway if another 8 or 10 or 20 loyal users get fed up & leave the community.

Ohhh, wups! I apologize! I used the word "community". It just slipped out. I won't do it again, I promise.

From: kevina@clark.net
Message-ID: <2vippm$7ln@clarknet.clark.net>
Source record: 100001

Thanks to the help of Jeff Lodoen the antic archive is up and running...
It Is at
ftp.clark.net:/pub/atari/mag/antic

Here is the readme file:

This directory contains all the disks that went with the Antic magazine
which was a great atari magazine.

Each issue is in a separate directory. Where possible I have also broken
it up by disk side. If no side is given, assume that it contains both.

The file "index" is in the following format:

FILE.XXX: title, subject, author, size in SD sectors (file format)

The directory "base" includes some of the core files that were included
with almost every disk.

I want to extend a special thanks to Jeff Lodoen at
Jeff_M_Lodoen@cup.portal.com. He was responsible for uploading most of
these files and created the index file.

If you have any problems with this archive please contact Kevin Atkinson at
kevina@clark.net.

3671. XF2 images

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-08 06:43:13 UTC
From: gtkakega@thunder.LakeheadU.Ca
Message-ID: <2210@thunder.LakeheadU.Ca>
Source record: 100007

There is an MSDOS program at atari.archive.umich in /atari/8bit/Diskutils or maybe in /Sio2pc called ATRIMG11.EXE which is a very handy utility for processing ATR images. You can choose files to be created as an ATR image or you can extract files from an ATR image. These images can be single, enhanced, or double density. Just thought I'd let you PCXF2 users know.

And about banning emulator discussion in c.s.a.8., I must disagree.

gtkakega@thunder.lakeheadu.ca

3672. Atari archive (catch up with those C= users!)

Newsgroup: comp.sys.atari.8bit

Message-ID: <c8902477.773654514@sage.newcastle.edu.au>
Source record: 100004

As you might know, there are massive C64 and Sinclair archives already in place, now it's the 800's turn. Surely the copyright restrictions on the software can't be valid (considering their age) and it certainly won't decrease their sales by making them publically available (zero divided by 100% still equals zero).
Has anyone enquired about the legality of it yet?? (haven't been in the discussion yet)

lets breath some life into the 8bit scene!

> ftp site and play on my machine" written between the lines of their postings.

It's certainly true that being able to play older 8-bit classics on your
modern PC etc. is a big attraction, but many old 8-bitters have moved up
to the 32 bit age and no longer have their equipment or can't use it due
to space/repair state complications.

Face it, interest in the old 8-bit will continue to decline if all that
happens is that old 8 bit users keep swapping soft/hardware and talking
about the old days. Emulation provides a new lease of life to the old
XL/XE platform and gasp(!) MAY EVEN ATTRACT NEW/RENEWED INTEREST in
the machine.

For all intents and purposes the 8-bit no longer exists as far as
the wider public are concerned. If emulators start appearing in
numbers, many more people will come into contact with the 8-bit and
many old ex-users will renew their aquaintance.

THATS why I think 8 bit emulators should be included in this group.
By all means insist only on posts from actual users of full 8bit setups
and exclude everyone else (even those using SIO2PC to get enhanced
functionality for their 8bit system) but be prepared to watch the
8bit wither away and die.

Oh sorry, I'll just go out and buy one then. Whilst I'm at it
I'll get a load of my favourite old 8-bit software as the store
is sure to stock all that too. After all, EVERYWHERE stocks
the 8bit hardware and software........

And the point was that emulators and increased software and
documentation would attract users BACK to the 8 bit. Otherwise
its going nowhere fast like some other Atari computer platforms
I could mention.

Anyone for a Falcon emulator????

How does one make a new (non-alt) newsgroup? (Or where can I find out how?)
I feel it is not time for everyone to just SHUT up about "We're sick of
emulator talk!" or "Emulator talk belongs here!" and just stick the Atari 8bit
emulator talk into a whole new newsgroup.

Does anyone have any reason for this not to take place!? If not (I don't
expect any) then I will personally look into creating a new group for it
(again, what I'll need is direction to the correct WAY of making a new group).

Thanx!

> Thanx!

Much of the emulator discussion WILL be relevant to this group.
At the moment many people want to know where they can get it,
how to set it up etc. When people start using the emulator they
will have legitimate Atari 400/800/XL/XE problems. Should they
be segregated just because they are experiencing them on an
emulator instead of a genuine Atari manufactured 8 bit?

All this emulator talk show that there is still a hope
of rekindling some 8-bit interest in the wider computing
community.

Yes, see the threads on legality of distributing 8 bit software
via , say, an FTP archive.

The general consensus is that it IS illegal.

However, I say who is going to complain???? There are virtually
ZERO sales of the old 8 bit titles.

Maybe we could check with Atari vendors to see what they
have in stock and only put up old titles which absolutely
cannot be obtained through a vendor.

I'd say there are hundreds of old games which simply
no longer exist through sales channels.

I'm with you, making a software archive of classic 8bit
titles will breathe badly needed life into the 8 bit scene.

Source record: 100008

In a message dated 7-6-94, James King said:

"There USED to be quite a bit of diverse discussion here,
until the release of the XF2, that is -- now all talk revolves
around emulating, and not using the real thing!"

This situation will likely develop in very much the same way as it did over on comp.sys.cbm. The "real" 64 owners got more and more tired of persons who had just discovered one of the 64 emulators, asking the same type questions over and over again; questions which were emulator-specific.

One would think that now that the emulator talk has been successfully moved to its own group, that traffic would be way down. If it is, I have not noticed it. I suspect at least some of the traffic that substituted for the lack of emulator talk in comp.sys.cbm is from people who "tuned out" when those messages reached their peak.

Some have made comparisons to SIO2PC which are invalid. SIO2PC may "emulate" something, namely drives connected to an 8-bit, but even in doing so, it is a peripheral. OTOH, we have PC Xformer, which emulates the CPU itself, and requires as its base a substantially heftier piece of hardware than SIO2PC. It is not unreasonable one might pick up and old XT or AT-compatible to use SIO2PC.

My personal view is that if the talk applies equally to actual Atari 8-bit computers, then it is acceptable here, even if the person is using PC Xformer. However, the moment it steps over into an area that is specific to PC Xformer alone, it belongs in the comp.sys.emulator.misc group.

In the end, it will all depend on whether the emulator-specific talk begins to dominate this group, as it almost did in comp.sys.cbm. At that time, not only should it be moved to its own group, but would have sufficient message flow to justify it.

Another school of though is like mine: I have several computers, however
I can't have them out at once. Its nice to have them all on one desktop.
I'd love to have a coleco adam emulator, but since like only 4 were sold
its unlikely I'll see one.
I hope a descent Atari 8 bit emulator is made soon. My 800xl is
dying slowly.

The Atari accoustic modem is model 830, and it connects to the R1: port of
the 850 Interface Module. Pinouts are in the FAQ List. The highest baud
rate supported by the 830 Accoustic Modem is just 300 baud.

Someone else will need to supply you with the power supply requirements.

In the readme file for PC Xformer 2.0, there is a question asking people to suggest other 32-bit platforms they would like to see PC Xformer ported to, including the 68030/680480 based Macs, the Atari Falcon, the PowerPC, etc. Whatever platform gets enough votes, I will port Xformer to.
So should I take your question as merely a question or as a vote for the Mac, and if so, which Mac (680x0 or PowerPC?)

Hell Everyone, my friend Per Erik Peterson just recived a pro BBs package yesterday, cool..
We are looking for any Pro BBs in Europe we could exchange mail etc. later..
We are also looking for this "used" PRo-BBS advertised here not long ago, please email me.

/peace

Hello? I'm right here. If you have something you want to tell me,
you can either send me email or write me a letter. I appreciate all
the ideas that people are suggesting for enhancements to Xformer
and the bugs that have been reported so far, but seeing as I am going
to be out of town for most of the rest of the summer vising Atari
dealers in Europe and doing the rounds at several Atari shows
(first one coming up with the INdianapolis show in two weeks)
I am not going to be online to listen to all the "could someone
tell Darek this" or "could someone tell Darek that" or "gee, how
does Xformer do such and such. I'm too stupid to just ask Darek
myself" or "why doesn't Xformer do this" sorts of postings.

So if you want to see bug fixes and features added to future
versions of PC Xformer, you have to tell me directly because
I won't be reading this newsgroup for the next few weeks.

3690. P:R:C, XM301, Indus, Rana comment

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-08 16:10:56 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Jul08.121019.27641@wariat.UUCP>
Source record: 100018

(J.King asks about P:R: Connection, Eric Palm asks about xm301 and Itay Chamiel asks about Indus and Rana.)

P:R: Connection. Strange, but two things come to mind. One, slow down your Hayes with atn0, ats37=8. Two maybe you have an earlier than version 4 P:R: Connection as described by B. Poehland.

XM301 handler: Jim Dillow's xm301 handler allows running virtually ANY 850 software with the xm301. I think this handler was included with the latest BobTerm (1.22 I think), which should be in the umich archive.

Indus: I wrote a program to actively set the density (1, 2 or E). Often, the Indus is supposed to automatically detect the density, but doesn't. Hit the button to see what density you are at (#2 from left.) If it says 'C' and you still can't read beyond 720, then I don't know.

Rana: There are four dip switches. I don't have my docs, but 1 and 2 are for drive #, 3 for density and 4 for self test I think. Sounds like you are only changing one of the drive # switches, or one of your switches is defective. You gotta turn the drive off to change a switch.

4096 colors? Yikes! That's a program I haven't tried. If ColrView is
freeware/shareware, can you email me a copy? I assume what they probably
do is have two different images that they switch between every vertical
blank to get the effect of more than 256 colors. That should in theory
work on a fast enough VGA card although it depends how fat
oops, how fast they're doing it.

When you're running mondo color rainbow type programs, I recommend that
you press SCROLL LOCK to put Xformer into normal speed mode. In fast
mode it does not refresh the screen on every vertical blank, therefore
if there is rapid screen switching it would lose most of those. That
might explain the grey display, but I'd have to see it myself to say
exactly what's causing it.

>
>thanx.
>Victor

You can't start the emulator without BASIC. You have to boot with BASIC
then press the Shift+F10 keystroke to toggle BASIC off as described in
the doc file. I might add a command line switch to do that since it seems
a lot of people would rather type in 4 or 5 extra characters at the
command line then press one keystroke. Go figure.

Double density (or any size virtual disk image) can be created with the
SIO2PC software. PC Xformer doesn't do so itself since the transfer programs
for both SIO2PC and the Xformer cable create the images.

If you just want to whip yourself up a quick and dirty 184320 byte file
that can act as a double density disk image, do this:

COPY /B DOS25.XFD+DOS25.XFD DD.XFD

from the MS-DOS prompt. This basically takes the two 90K files and
merges them to create a 180K file. Now boot up MyDOS 4.5 as D1: and
DD.XFD as D2: and then format D2: as a double density disk and
write the DOS file to it. Now you can go ahead and boot up with
DD.XFD as your double density D1: boot disk.

- Darek

>does the Xformer allow copying a disk image from an Atari floppy to
>3.5" media??
>
>Thanks, David

Xformer is not a file copy utility, so getting the 8-bit files
to the PC has to be done ahead of time. There is a p/d utility
called UTIL that lets you read 8-bit double density disks directly
on a PC provided you have a 5.25" drive on the PC.
There is of course the SIO2PC cable and the Xformer cable for
transfering over entire disk images.
But the easiest way to download 8-bit software is the same way
you download Xformer itself - download it by modem from a BBS
or use two modems and download the 8-bit files from the 8-bit
Atari to the PC. You DO NOT have to use the disk images to
run 8-bit files. Just download the 8-bit file directly to
MS-DOS as an MS-DOS file and Xformer can read it.

3696. Re: 8-bit Atari Emulator discussion (Please read)

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-08 16:51:54 UTC
From: vparada@tuetue.inf.utfsm.cl
Message-ID: <2vk07a$1jj@tuetue.inf.utfsm.cl>
Source record: 100021

Hola mundo.

Two ideas:

- Create a comp.sys.atari.8bit.emulators

or

- Post in this group with "XF2:" string starting your subject.

That would simplify the life to those which only has a real 8bit :-)

Another idea:

- Create a "PC", "Emulators", "XF2" or whatever directory under the 8bit
directory at the a.a.u.e, and store there all stuff concerning these
(emulators, windows icons, .XFDs, and all that code that won't run
under the 6502 processor, but on x86's).

May these ideas arrive to late, but my news server is far enough from the
rest of the world :-(

Bye... ++Vitoco

3697. 8-bit Atari Emulator discussion, Summary

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-08 17:15:29 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <2vk1jh$bal@usenet.INS.CWRU.Edu>
Source record: 100019

I must say, this has been an interesting exercise. After two days I count 19 responses to my suggestion, containing everything from "Amen!" to "you're a weenie." In all, 10 individuals have expressed support while 9 have expressed disagreement, or very roughly a 50-50 split.

Thanks to everyone who has expressed his/her opinions, on news or in e-mail.

However, I really believe many of the people disagreeing with my suggestion did so without understanding it. For reference, here it is again, highlighting now added:

>I propose all discussion about the _usage_ of 8-bit Atari emulators such as
>PC Xformer be moved to comp.emulators.misc. Questions and answers about
>_writing_ 8-bit Atari emulators should be cross-posted to both
>comp.emulators.misc and comp.sys.atari.8bit. Discussion about the 8-bit
>Atari itself, with no regard to functionality under emulators, remains on
^^
>comp.sys.atari.8bit.

Let me try stating it again. Topics about using emulators, topics that would not exist without the emulator, should be discussed on comp.emulators.misc. Topics about the 8-bit Atari computing platform, _whether emulated or not_, remain at home on comp.sys.atari.8bit. Don't you see, if the emulator really works, you _are_ using an 8-bit Atari, emulated in software, so of course you're welcome on comp.sys.atari.8bit. We can't tell whether you're using the real thing or not. On the other hand, topics on how to get the emulator to work, what games work on it, where to get Windows icons for it, etc., would not exist without the emulator, and so are not of interest to the 8-bit computing platform. If the fact that you're using an emulator is important to the topic, the topic probably belongs on comp.emulators.misc. Obviously, there will be times when crossposting to both groups will be appropriate.

I have nothing against emulators, or the people who use them. Does anyone remember how often I've posted the contact information for Branch Always? Does anyone remember I was the one who posted the PC Xformer release announcement to comp.emulators.misc? I hope to try the thing myself soon.

Emulation of other systems _is_ a hot topic, among all platforms. The Usenet community has already begun to address this issue with the creation of the comp.emulators.* hierarchy of newsgroups. First of all, comp.emulators.announce was created for news about any type of emulator. Beyond that:

Apple][emulation topics moved from comp.sys.apple2 to comp.emulators.apple2
Commodore 64 emul. topics moved from comp.sys.cbm to comp.emulators.cbm

(Isn't it interesting that there are so many more emulators of these than
of the Atari?)

They also had the initial foresight to create comp.emulators.misc for all
other emulators not covered by these two newsgroups. 8-bit Atari included.
Are we going to stay in our little hole and ignore this group created for
us, or are we going to take advantage of it? Some people express
reservations about having to wade through a general-purpose group without
"atari" in the name, but let me point out, comp.emulators.misc sees about
30% of the traffic of comp.sys.atari.8bit. What about the roughly 50% of
comp.sys.atari.8bit inhabitants who have to wade through your threads here?
There's plenty of room for 8-bit emulator topics on comp.emulators.misc.
That's what it's for! Interestingly, readers of comp.emulators.misc have
universally accepted my above proposal. If someday comp.emulators.misc
gets overcrowded with 8-bit Atari stuff, it may be necessary to create a
comp.emulators.atari.8bit, but that day is far down the road. There's
plenty of room in comp.emulators.misc for now.

Some of you don't want to have to read newsgroups other than
comp.sys.atari.8bit, but I urge you to take a broader perspective. What I
want to see is the 8-bit Atari community continue to rise in prominence in
the Internet community. There are a many 8-bit Atari owners on the net who
have never found comp.sys.atari.8bit, or just assume there's no one here.
Bringing the FAQ List to prime time (cross-posting to *.answers) has
attracted many new faces to comp.sys.atari.8bit. Some people complain that
comp.emulators.misc may not be widely distributed, but what about those
sites who receive it but not comp.sys.atari.8bit? Ever since its creation,
the question "Are there any Atari 800 emulators" has been recurring on
comp.emulators.misc. When I took the time to post the PC Xformer
announcement, again many new faces were drawn to comp.sys.atari.8bit. I
want 8-bit Atari topics on comp.emulators.misc not to get them out of
comp.sys.atari.8bit so much as to help attract new faces to
comp.sys.atari.8bit. If Apple][and C=64 emulators are disussed in
comp.emulators.*, 8-bit Atari emulators should be discussed there too.

I hope this clarification helps you better understand where I'm coming
from. So where do we go from here? In the end, Usenet is anarchy, always
has been, always will be. So post where you want to. But at least as a
result of this thread, we now know that around 50% of the population of
comp.sys.atari.8bit is not happy with the proliferation of emulator usage
topics on the group. You know such topics are more than welcome on
comp.emulators.misc. Also know that discussion of the 8-bit Atari
platform, whether emulated or the real thing, is always at home on
comp.sys.atari.8bit.

Thanks for reading,

KENDRICK@sonoma.edu wrote:
: How does one make a new (non-alt) newsgroup? (Or where can I find out how?)
: I feel it is not time for everyone to just SHUT up about "We're sick of
: emulator talk!" or "Emulator talk belongs here!" and just stick the Atari 8bit
: emulator talk into a whole new newsgroup.

I think emulator related questions (like how do I get sound out of this damn emulator, or why doesn't Q-Bert run on this emulator) belong to an emulator newsgroup, but questions relating to Atari software/hardware should be directed here. I think that any real development that will take place under an emulator will not be accepted to the real Atari 8-bit community, chances are the software will not support common drives and modified setups.

But I see no need to get rid of emulator users, I just think emulator related questions do not belong here, alot of the users here don't use them and the messages are becoming annoying. But I could care less either way.

3701. XF2 Questions, why not make an FAQ?

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-08 21:06:52 UTC

Source record: 100023
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit

Ok, I'm not sure how many people are for a new newsgroup
(comp.emulators.atari.8bit) about the XF2 (and AT800XL and all the other
emulators which are / will-be-coming out), so I have another proposal.

I've heard complaints about "the same questions asked over and over"
(not necessarily re: XF2, but re: other platform (AppleII,CBM) emulators)
so I think someone (hell, ME?) should make a small FAQ file to be posted on
c.e.misc, c.s.a.8, and at the Umich and Clark archives to be placed right next
to the XF2.ZIP.

Anyways, if anyone's got any general questions that they either
1) didn't get answered
2) got answered but have a feeling others might ask as well or
3) heard asked a lot

please e-mail them to me and I'll try to put together a little XF2 FAQ.
(Also send me comments on this idea: bad/good?)

Funny - reading your message about the 8bit dwindling and dying.

I dont recall seeing your name in this digest ONCE -- UNTIL the XF2
emulator was released. Where were you prior to the release of
this software?

For those of us who have been around, this digest has gotten more
active BEFORE the emulator, so your theory is very wrong.

-James King
kamaro_kid@delphi.com

3703. Re: 8-bit Atari Emulator discussion, Summary

Newsgroup: comp.sys.atari.8bit

Again, I would agree with your statement.

If the discussion revolves around 8bit software, etc.. then it belongs in comp-sys-atari-8bit -- but if it revolves around settting up XF2, or creating the disk images, then it belongs elsewhere.

Lately, most XF2 messages have revolved around IT - rather than around 8bit software, etc..

Before you shoot off at the keyboard, perhaps you had BETTER call the
remaining 8bit soft/hardware vendors. You'll be suprised to find that
MANY MANY titles have been purchased and are still being actively sold..

There are 2 in Santa Clara, CA alone! (BEST and B&C ComputerVisions), with
many more throughout the world.

Again, I ask - where where you a few weeks ago? You're obviously new
to this group..

Message-ID: <6373@tdbunews.teradata.COM>
Source record: 100028

In article <2vilt4$ogb@nwfocus.wa.com> junkster@chinook.halcyon.com (James Hague) writes:
>I have one simple objection about the dicussion of Atari emulators.
>From my experience, the great majority of interest in emulators for older
>computers is from people who have "I own a PC/Mac/Amiga and think it is
>great and I don't care about the C64/Atari/Spectrum/Apple II but they
>have lots of awesome games that I would love to be able to snag from an
>ftp site and play on my machine" written between the lines of their postings.

Uh, sorry to pop up here in the middle of all this, but I do think that
the majority of interest in emulators, specifically for Atari 8-bit
emulators on IBM machines (XF2), is from people, who like myself, had
an Atari 10+ years ago, and have kept up with technology while still
hanging onto the old hardware/software they had as a kid (young adult)..

When I was 12, Pac-man on my 800 was the closest thing that could come
to the real arcade experience! :) Now days, if it doesn't speak,
have 16 million colors, or looks real, it isn't work playing.. but
us here know better.. so we still want to find a way to hang onto the
past (?) through being able to play software on our current machines
though the original platforms have long since died...

My top 5 Atari Games:

1: Alternate Reality: The Dungeon
2: Alternate Reality: The City
3: 7 Cities of Gold
4: Return of Hercurles
5: Ali Baba and the 40 Thieves

:)

Source record: 100036

Now with a working Atari 8bit emulator, I want to testdrive the program a bit. The problem is that I've never used an Atari 8-bit machine before. I can use C64, Atari STs, Amigas, PCs, Macs, Unix boxes, etc. but I fail to get a directory listing and run programs.

Is there a manuals for the Atari somewhere so I can actually *use* the emulator instead of typing nonsense like

```
10 ? "Hello world"
20 goto 10
```

Ruud van de Kruisweg

3711. Atari 8bit for newbies / XF2,etc FAQ TO BE WRITTEN!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-09 07:17:38 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940709001749.238050b8@sonoma.edu>
Source record: 100041
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit

I will personally write a small FAQ which answers a lot of the stupid (or just inexperienced ('how do i get a directory?')) type questions about the Atari 8bit and it's current useful emulator, the PC X-Former 2.0 (XF2)

I will hopefully write it and get it out by tonight (although I DO need to get up early! :))

8-bit Ataris kick ASS! They RULE! They RULE!

3712. Darek - 4096 colors

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-09 07:27:08 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940709002721.238050b8@sonoma.edu>
Source record: 100042

DAREK! You wrote a WHOLE EMULATOR AND HAVEN'T EVEN SEEN COLRVIEW 2.5!? (it's been out since, oh, what, 1988 or was it a 1990's program?)

Ok, here's what it does, it rolls through three different screens and changes the background color about 192 times per frame.

The first frame looks like this:

Red data
Green data
Blue date
etc.

the second like this:

Green data
Blue data
Red data
etc.

and the third, you guess it, like this:

Blue data
Red data
Green data
etc.

Anyways, within three frames, one location on the screen has had 1 out of 16 reds, 1 out of 16 greens, and 1 out of 16 blues in it, thus you get a total blended possibility of 4096 colors (16 x 16 x 16) in a 'true color' style (red/green/blue vs. Palette like on IBM's (which do 256 out of 256k) and standard Atari OS screen's (which do 4 out of 128))

Anyways, I think it'd work just fine if you were to simply make sure the Graphics 9 (and 11 also, for us APAC (256 color blended out of the 16 greys and the 16 atari hues) fans) would be AFFECTED by palette changes... inotherwords, if you did this:

```
10 GRAPHICS 9
15 FOR A=0 TO 15:COLOR A:PLOT 0,A:DRAWTO 79,A:NEXT A
20 IF PEEK(764)=255 THEN 20
25 POKE 764,255
30 POKE 712,16
35 IF PEEK(764)=255 THEN 35
40 POKE 764,255
45 GRAPHICS 0
```

then you'd get the following:

A black screen
16 shades of grey drawn down the first 16 (out of 192) lines of the screen
[press a key]
the black turns to darkest yellow, greys to shades of yellow, white to
brightest yellow
[press a key]
back to text screen and 'READY' prompt

Anyways, I'm guessing (I cannot use XF2) that you forgot about the fact that changing values in location 712 (and it's non-shadow register) ALSO effect the hue of Graphics 9 screens! (and the lum of Graphics 11 screens)

So, got it!? If you do this, I'm sure CV9 mode will work fine on XF2! :)

btw - to all you XF2 comment haters, don't think of this as a post about "why XF2 can't do such&such", but more as a lesson on how the Atari does CV9 mode :)

later!

Not only are you WAY off base, but your message is insulting.

You see, most of us online have other machines in addition to our 8bit Atari's, but feel more inclined to use our 8bit more often..

Me, personally, I work on a SunSparc10, Compaq 486/66, VAX VMS and other high end machines all day long - in addition to having a high end Pentium Class machine at home..

I'm frankly not impressed by 66-100mhz speed or the lack of idea games on the market for these machines - and simply enjoy using my 8bit Atari..

Again, you're one of these Johnie-come-lately users that just barely decided to join this group BECAUSE of the emulator. If you're so keen on seeing the 8bit Atari live on, where were you a year ago?

-James King
kamaro_kid@delphi.com

From: jharris@cup.portal.com
Message-ID: <116766@cup.portal.com>
Source record: 100044

>Michael Current <aa700@cleveland.Freenet.Edu> writes:
>
>>I propose all discussion about the _usage_ of 8-bit Atari emulators such as
>>PC Xformer be moved to comp.emulators.misc.

Atari8 people are the most qualified to answer questions about running Atari8 software. They aren't likely to get their questions answered in c.e.m., and Atari8 people are not likely to patrol that area looking for such questions.

I have no objections to helping anyone run Atari8 software -- even if he is using a different computer. More likely than not, the PC Xformer user is going to be a prior or current Atari8 owner.

Keep in mind that PC Xformer is a new product, and that will always generate a lot of interest at the start. Expect traffic to die down considerably after awhile.

John Harris - jharris@cup.portal.com

3715. Argh! Emulator discussions stink!

Newsgroup: comp.sys.atari.8bit

From: kamaro_kid@delphi.com
Message-ID: <Bg-yRTw.kamaro_kid@delphi.com>
Source record: 100040

After threading through all this drivel about the newly released emulator,
I think I'm going to go on a break from this newsgroup.

Who was it that suggested that all SERIOUS 8bitters would simply
wander off if these discussions didnt mellow? Well -- you were
right. Guess I'm the first temp. casualty.

Maybe I'll pop in a bit later to see if these Johnie-come-latelys
disappear to a digest of their own.

And to think that this USED to be a nice discussion group about
REAL 8bit hard/software.. Instead, I have to wade through 30
messages/day about setting up XF2, porting files over, "why do I
have to boot up with BASIC", etc..

-James King
kamaro_kid@delphi.com

3716. Emulator discussions?

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-09 07:53:34 UTC
From: dragnet@crl.com
Message-ID: <2vll1u$fsh@crl2.crl.com>
Source record: 100043

I read with interest all these comments about whether there should be emulator discussions here or not.

For those not on the digest, if you are using such a lame service that you can't set up a kill file, you don't have my sympathy. Just like those people that complain about pictures of naked men in the groups that carry pictures of naked people (naked people to them are naked women).

If you don't like it, ignore it. If you can't ignore it, use a kill file. If you can't use a kill file, you must have started reading c.s.a.8bit after the term "information superhighway" was coined (welcome, AOL, Delphi, and other users).

If you're on a digest... then you get a little sympathy... I have no suggestions.

Flames to /dev/null.

```
The Unofficial Atari 8bit | |
Newbie / Stupid Question / Emulator Help | |
FAQ \| |/
\/
By Bill Kendrick
Revision 0.0 !! PLEASE !!
July 9, 1994 ASK MORE QUESTIONS

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file (posted monthly on comp.sys.atari.8bit and available
at the Atari Archives at University of Michegan: archive.umich.edu in the
atari/8bit directory).

Objective of this file:
Much discussion has gone on in the comp.sys.atari.8bit Usenet
newsgroup about the newly released (mid 1994) Atari 8bit emulator for
IBM / MSDOS based computers, the PC X-Former 2.0 (XF2 for short). Many
people in the 8-bit community have gotten, well, fed up with the XF2-based
questions which do not pertain to them, or to the really dumb questions
which are in fact understandable to new or rusty Atari 8-bit users, but
have just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to (hopefully) reduce the number of 'newbie'
questions and to keep the XF2 questions out of the comp.sys.atari.8bit
newsgroup (and to keep them in comp.emulators.misc newsgroup, where they
belong (until of course there becomes a new newsgroup,
comp.emulators.atari.8bit)).
This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
suplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).
One note: this revision is being written at nearly 1am by a tired (and
not always grammatically correct person) in one of the crappier editors
on the Earth, Edit for MS-DOS.

---=== XF2 Questions: ===---

Q.6) What does "READY" mean?
A.6) This is the Atari BASIC prompt. See below for hints on Atari BASIC.
```

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System (which XF2 does not emulate).
A.2.2) Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.
A.2.3) It may just refuse to run on the XF2 emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported on the XF2.
A.4.2) (See Question 2).

Q.5) How do I exit XF2 and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XF2" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF2.ZIP file).

Q.7) How do I use MSDOS files with XF2?
A.7.1) Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image).
Example: XF2 MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS 4.50 disk image and D2: will be a write-protected disk which contains only the file "filename.ext". Note: there are bugs in XF2 which make accessing files from different directories a bit hard, just use the MOVE (or COPY and DEL) commands in MSDOS to get the file to the directory where you call XF2 from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities directory at the UMICH archives) which allows you to access files within a MyDOS/compatible .ATR disk image without using an SIO2PC or the XF2. S2PC let's you read, write, delete, change directory, and view the directory of a MyDOS/compatible .ATR disk image. It can be used via command-line parameters from MSDOS, or as a menu.

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XF2 and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big as the disk they represent (an 88k disk image will use 88k on the IBM). .ATR files are used by SIO2PC (see below) as well as the XF2 (and the S2PC program mentioned above). .XFD files are used by ST X-Former (the Atari 8-bit emulator for Atari ST's) and PC X-Former (XF2).

Q.9) What's SIO2PC?
A.9.1) Refer to the XF2 and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use of a simple (and relatively inexpensive) cable, makes the IBM act as though it were an Atari disk drive. (Up to four drives, actually). It uses disk image files (.ATR's) and can also let the Atari access single IBM files (much like XF2 does) as a single file all alone in its own disk. It also currently allows Print-Thru (all access to the Atari "P:" (printer) device can be redirected to the IBM's printer, screen, or MSDOS file; different translations/conversions are user-defined when the Print-Thru mode is turned on). Finally, with the use of two programs on the Atari 8-bit (the only two programs that currently have anything to do with SIO2PC that have been written (to my knowledge) for the Atari 8-bit), the IBM can be controlled remotely (commands are sent from the Atari, typing on the IBM is not necessary) and files can be sent directly to the IBM's drives.

---=== Getting around on the Atari: ===---

Note: This will simply discuss Atari BASIC and Atari DOS 2.5 and MyDOS 4.50 (because these topics seem the most relevant to the less-knowledged/ experienced XF2 users).

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into the current program.
Entering a line number alone will remove that line from the current program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename (see below). To load and run a program, use the "RUN" command followed by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo) BASIC's commands and their usage. (A larger file may be produced which will be based on examples provided in the Atari BASIC Reference Manual). (As of today, 7/9/94, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines (Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP] to go to the Self Test when the Atari Rainbow appears).

A.3.3) For XF2 users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be

POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XF2 doesn't support sound! But, anyways:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) ??? Clears any TABstop under cursor
SetTAB ([ShTAB]) ??? Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them.

When simply entering text, type [ESC] then the edit key and the
character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an
ESC beforehand, so first type [ESC],[ESC] to make an ESCape character
appear, then type [ESC] then the edit key and the character for that
edit key should appear. When the PRINT statement is executed, the
first ESCape (which you typed as two [ESC]'s) will make the editor
SHOW the following character (even if it is an edit character), then
the character which you entered (with [ESC] and then the edit key)
will make that character appear. This makes it difficult to align
a set of PRINT statements which make a multi-line picture or menu
which uses viewed edit keys. It is probably best to have all of the
lines in your program with the PRINT statements that can fit visible
on the screen, then edit them (without putting any of the ESCape
characters in, then when the picture looks like how you want it on
the screen, move the cursor to on top of each edit-key character and
press [Control]+[>] (Control-Insert). A blank space should appear
under the cursor and the rest of the line should move right. Now,
type [ESC],[ESC] and an ESCape edit-key character should appear
where the blank space was. When you are finished doing that for
each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE
PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1"
to turn on the no-edit mode (ALL characters except End Of Lines
will appear, even ClearScreens!) When you want to go back into
normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc)
minutes, the screen colors begin changing, thus protecting your TV
or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the
command "POKE 77,0" at least once every few minutes (IF the screen is
active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having
location "77" set to "0", or set location "77" to "128" with
"POKE 77,128", voila! instant attract mode!

Q.10) Why the abrubt ending?
A.10) I have to go to bed now! I must get up at 7am and it's now 2:20! :)

Contacting the author:

I (Bill Kendrick) can be contacted at:

"kendrick@vax.sonoma.edu" Internet Email address,
on the "comp.sys.atari.8bit" and "comp.emulators.misc" newsgroups, or
New Breed Software, 59 Palm Lane, Novato, CA 94945 snail-mail address!

PLEASE add questions and report any mistakes or bugs to me ASAP. This revision (0.0) will not last very long because I'm going to work on this quite a bit when I get more free time (7/10 or 7/11/94).

Gawd!

Now there's more damn messages in the group
whining about XF2 posts than actual posts about XF2!

And exactly *one* hypocrite whiner that I won't name.

Some people here are acting like 2 year-olds by posting
over and over ad nauseum "WAAAAAAH! XF2! WAAAAAAAHH!

Grow up already.

Tim Hester

[next I suppose there will be a slew of posts whining
about posts that whine about posts whining about XF2] :-)

Umm.. correct me if I'm wrong, but this is the most excitement there's been in this group in ages. If the 8-bit situation is going to improve, it cannot happen on dis-continued hardware alone. New products, designed to extend the reach of the 8-bit to more people, are the best bet for re-kindling interest in this largely forgotten machine. I agree that there's no substitute for a real 800XL sitting on my desk, but being able to emulate it on the world's most popular platform is the best shot in the arm the 8-bit will get. The fact that people are using this emulator means that people still like running 800 software, if they don't have to deal with a second system. Why not put XF2 in your kill file until the kinks are out of the XF2 situation and people have fewer questions. I also suggest someone make an XF2 FAQ so people can check there for answers first.

I know many people here want to be 'purists' who refuse to use their software outside the context of Atari-made hardware, but that isn't the way to draw people back to this exciting platform. I figure emulators like XF2 will get people back into 8-bit software, and if they get really hooked, maybe they'll buy an 8-bit system for maximum compatibility, if not, at least we have more people running 8-bit software which increases the potential market for 8-bit developers.

-Bry

Continued from the previous message...
<*>
contemplate. The shelf space allotted to the Atari, both ST and 8bit, gradually lessened from a full rack, to a half rack, to a single shelf, and finally, to a bargain box in the back of the store. The only real justice is that the same thing had already happened to the Apple][wares, and C64 stuff, a little later on.

Now, as to the subject of other hardware alternatives like the MARS8 that you referred to I'll offer this: where there is life, there is hope. As long as developers and their venture capitalists (or whatever they want to be called today) see a market that can be exploited in sufficient volume to support returns on investment, there will be new product. It has little to do with whether or not an all-software emulator will succeed or not. I see them as parallel developments, not in competition with each other.

Now I'm not against the purists. Hey, if I were not forced by my business and my profession to use IBM PC compatibles, then I'd probably still be using SynCalc to balance my checkbook. And I'd be bleating about the emulator traffic in the digest along with them. But I tell you this: The Atari 8bit community has shrunk to such a small size that every damn user should be welcomed, not told to go away if they don't live up to Joe Blow's idea of what constitutes a valid Atari platform.

I'll say more, at the risk of incurring some flames, that anyone who wants to further the future of Atari 8bits had best think twice before slamming emulation, because someday, those custom chips that make your 800XL or whatever go, go, go will be gone, gone, gone. And at that point, neither love nor money will bring your machine back to life. And if the purists are successful in driving emulator users away with their short-tempered edicts, such that the developer drops the project, perhaps they will be the ones to lose in the end. To paraphrase a long-dead bright wit: The OS you save may be your own.

I've read this digest with some interest for a few years now via cross-posting to GEnie, and I have to admit that it was pretty slow until the release of XF2. But now, not only are we overwhelmed with newbie XF2 questions, but we have the added topic of "How do we get rid of the newbie XF2 questions?" Well boys and girls, it's easy. Just killfile all messages containing the keywords "XF2", "XFormer" and "emulator". That solves your problem, doesn't it? Then you can go back to reading 5 or 6 messages per day, like for the last couple of years. <g>

If your reader doesn't support killfiles or twit filtering, then you've got a problem, because _this_ is precisely where the majority of the

newbie XF2 articles are going to end up for the foreseeable future. Like it or not, even after the creation of a c.e.8 newsgroup, (if that unlikely event ever happens) most people will come here for information on XF2.

My credentials? Hardly any. Opinion? Yes, mine and mine alone. Flames? Fire away. I have some history, but that's... another story.

Hola Bill!

CC: Michael Current,
Kamaro Kid,
British

May I interject? Come late to the party, yet still I ponder...

Bill, from your statements I take you to be an intelligent, informed individual, but a few of us have lived with Atari's errors for more than five years. I can count myself as having been a closet Atari user for at least that long, (banished to IBM-land, natch) and for more than five years before that I was as ardent an Atari cheerleader as you can imagine. This article is not meant to discount your experiences or dispute your convictions, merely offer an alternative viewpoint as a means to furthering intelligent discourse, and possibly disarming some of the more volatile amongst the faithful. That being said, let me begin the flogging. <g>

I seriously doubt that Atari will ever lift a finger again in support of the existing 8bit userbase, except to possibly jerk us all around again to get us to buy one of the newer machines. When Jack Tramiel took over from Warner it was obvious where he was leading the company, and it's even clearer when looked at with the benefit of the intervening years.

I come away from the experience with a bad taste in my mouth for the company since the Tramiel clan took over. They promised support, and never gave it. They promised an upgrade path, and then basically told us that the best way to upgrade was to dump the 8bit and buy an ST. Not

bloody likely.

Actually, even before Jack took over, Atari Corp. was fraught with troubles. Always the developers were getting screwed. Stuff was brought to market that sucked bigtime, although in all honesty this was not Atari's fault per se. The XL's were not very compatible with the original OS, and as such, a number of "translator" disks became necessary to run some software. I'm sure you've run into this a few times, as the 1200XL was the least compatible of the lot. I know about this intimately, 'cuz I lived through it with a 1200XL. Nice machine otherwise, except when a cart didn't fit right, and you had to hacksaw a couple of notches in the cart case. <g>

Sidenote of little historical significance: At this point in my oh-so-droll diatribe, I got curious about the actual dates that I bought my Atari computers on, and began prowling through my original invoices. I wish I had a hand scanner so I could send you all a copy of the one invoice that I found. On 09/30/83 I bought an brand spanking-new Atari 1200XL (boxed, in the foam!) and a Rana 1000 (SSSD!) disk drive at the same time. $349.00 for the computer and $399.00 for the drive. Total with Illinois state sales taxes, $792.88 in hard-won 1983 dollars! I can't locate the invoice for the 800, must have been _much_ earlier. And the 130XE was bought el cheapo when a local store gave up on Atari in October of '87. (I still have them all, and they all still work. It's the disk drives and the diskettes that are all croaked.)

And lest you think that I'm not an Atari fan even now, let me assure you that I LOVE ATARI COMPUTERS! You may not class me with the kind of Atari user that disdains all other platforms, but I think I fall into the "eternal" group of Atari fans. That will never change. (Ya wanna see my version of "Warlord Of Mars" in Atari BASIC? Only 7 years old, never raced, never wrecked, original rubber. <g>)

But I digress. What I wanted to get across to you was that when a company stops producing a product line, it's a dead product line. Time is against all who believe that 8bits will never die. I watched during 1984, 1985, 1986, etc. as new software releases dwindled. Eventually, I stopped going to the software stores because all I saw that was new was for the Commodore 64 and the IBM PC. It was too, too depressing to
<*>

3725. Atari to PC for a newbie...

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-09 17:17:22 UTC
From: sydtech@winternet.com
Message-ID: <2vmm32$7oe@blackice.winternet.com>
Source record: 100051

Hi. I've seen items on this in the past, but don't know where to find them. I need to transfer some files from my PC to my Atari. I've got the following equipment available to do this: a Compaq 486/66, an old Epson 386sx that has a 5 1/4 floppy drive on it, and an Atari 1200XL with a stock 1050 disk drive on it.

I've heard of a utility program that lets me read and write to Atari disks on the PC. I've also heard of something called SIO2PC that lets me use "virtual" disks on my PC's hard drive.

Can some kind soul give me details on these or any other utilities available for 8-bit-to-PC connectivity? The SIO2PC setup sounds the most interesting....what exactly would I need to get this working?

I just rescued my old 1200XL and a ton of disks from a friends basement and have been having a great time with it. I'd really like to start downloading stuff with my PC and transferring it, so any help anyone can give me on this would be greatly appreciated!

Thanks!

Scott

It's a different program.

Be careful with atarimg. I trust it for single density images,
but it doesn't do double very well.

S2PC seems more robust in it's support for all types of images.

Those who say "the emulator discussions are giving the 8-bit a shot in the arm, there is nothing else productive going on" is ignoring the yet to be seen line of FTE hardware/software enhancements. Essentially an emulator, emotionally speaking, says "the 8-bit is dead, let's entomb it and run it in emulation". Anyone with a machine fast enough to run PC Xformer will not be the type or person likely to want to follow the path FTE is going to blaze with the real thing. As such in a way it is a threat to FTE's "this is our last chance to power charge our 8-bits" project.

I like having an emulator waiting for me as a means of immortality for the 8-bit, but I wouldn't want everyone to switch over to emulators right now. Not until all developers go under and things are TRULY over.

Subject: Re: Argh! Emulator discussions stink!

What's your problem? It makes no difference if an Atari 8-bit operating
system is run on an 400, 800, 800XL, 600XL, 1200XL, 65 XE, 130 XE,
486 or Pentium computers. We're still all 8-bitters at heart.
The XF2 means a new piece of hardware for running Atari 8-bitters.
I've been using Atari's for 11 years, I can program in Assembly, Action!
BASIC and C on my 8-bitters. I own a 800 and 800XL, a 410 program
recorder,a 810 drive,a XF551 drive, and a 1027 printer. All we want to do
is discuss ways for using the 8 bitters(including on Intel based machines
) Have you you used Atari's
as long as I have? What right do you have to say that there should
be no talk about running Atari software on the my 486?
We're discussing Atari, not emulators.
This is the future of the Atari 8-bitters, like it or not.
Change is easy, but deciding to change is the difficult part, at least
for you. Do you realize the potential of this emulator? Given the
right hardware and software you can have multiple Atari 8-bit
programs running simultaneously. We're talking full pre-emptive multi-
tasking of the Atari OS, Atari DOS, and 8-bit software.
Theoretically you could compile an
Atari program under Light Speed C while playing The Last Star Fighter,
plus download at 14,400 baud your favorite Atari Software! It seems to
me this is all about Atari, not emulators. We're talking
about going beyond what you previously thought was possible with
the Atari OS, Atari DOS, and Atari software.
You must use a computer besides an Atari 8-bitter.
Don't tell me your main computer is 130XE wih a black box.
You're telling me you have no use whatsoever for this emulator or it's
future versions? We're talking about progress here. There hasn't been
any progress for the 8-bitters in a long time.
When Atari decided to equip all 800's with 48K of memory, were you
complaining then too? When Atari decided to scrap DOS III in favor of
2.5 were you complaining then too? When Atari decided to scrap the CTIA
in favor of GTIA were you against it?
We're talking progress and the future!! Get with it!!

<deletion>

Well, you put words in my mouth. I never suggested "the 8-bit is dead",
what I suggested is that emulation is a great way to broaden the scope of
the 8-bit. The XF2 is not a "last chance" for the 8-bit, but rather a new
development. I won't use XF2 as my 8-bit, but I can see how being able to
do so will make this platform more feasable for the average user. If you
say "I don't want such people around", then I cannot agree with this 8-bit
eleteist attitude. There's no matching the real thing, but the fact that
people are willing to try is a good sign.

I'm wondering where I can get a copy of the TurboBASIC XL runtime package which has a fixed clock (ie, doesn't gain 10 seconds per minute.. inotherwords, it goes from 0:00 to 1:00 when in reality, a stopwatch or something would only say 0:50) ???

Thanx
-bill
---
reply

Hi Bill,

This comes to you courtesy of Ted Skrecky (I'm not on InterNet). He usually captures comp.sys.atari.8bit and passes it on via our club BBS.

I'm glad you raised the question as, when I patched Turbo for NTSC, I never thought about RUNTIME since I shun (read "despise") compilers and have little interest in BASIC except as a handy calculator. The only reason I did the fix in the first place was to see if it could be done. Subsequently, there never was a "TurboBASIC XL runtime package which has a fixed clock". There is as of now.

The code for time functions in all versions of Turbo (XL, 800 aka Frost, and Tom Hunt's Sparta mod) is identical albeit at different addresses. Your query lead me to put RUNTIME through a disassembler and I discovered that the code is only slightly different and again, at a different address.

If you load RUNTIME into TextPRO or a Turbo string and do two simple substitutions, the same patch should be effected. First you find a floating point number for vblanks per day (24x60x60xvbi/second). The PAL value is 4.32*100^3. For NTSC, this needs to be changed to 5.184*100^3. To do this find the byte sequence 67,4,50,0,0,0 (should be at byte 9806 counting from 1) and substitute bytes 67,5,24,64,0,0

Bytes 9854-9859 consist of two JSR's, one to a multiply by 5 routine and the next to a multiply by 10. For NTSC, this is changed to a single call to a multiply by 60 routine and three NOP's. So find 32,12,252,32,6,252 and substitute 32,45,252,234,234,234. Neither "find" sequence occurs anywhere else in the program.

I took a test clock program I'd written for the interpreter mod, compiled it, and ran it over a five hour period. It lost about 20 seconds which is the same as the modified interpreter and similar to Sparta's TDLINE.

If you want more info, I can be contacted on the USF net (cross netted with the Forem net) under the enigmatic handle of my initials "jkp". Of course, you could also hurl invective at me through Ted via InterNet

3734. Disk Communicator Program

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-10 02:35:31 UTC
From: ud264@freenet.Victoria.BC.CA
Message-ID: <1994Jul10.023531.14233@freenet.victoria.bc.ca>
Source record: 99914

Hi 8 bitters,

I wondered if any of you use the disk communicator program by Bob Puff.

I have tried on-and-off to use this for some time, but although it loads
and appears to run, the disks created all have one common flaw....

Every sector written has the hex value 82 in place of whatever byte
should be the 3rd byte of the sector!

I have tried using Dos2.5, Mydos and Spartados, I've also tried
a stock 800XL, a 256k 800XL and a 130XE. I've also tried both
diskcomm.com and dskcom32.obj from various archives, and various
*.dcm files.

The only thing all these have in common is the disk drive (and me!)
which I think is a happy 1050.

Anyone help???

All after here is the reply

Greetings Mark, from "the colonies",

I doubt DiskComm is your problem as it works well and you've tried different
copies. My guess is the culprit is the Happy as it's the only common factor
and DiskComm is not reporting errors.

Several years ago my user group librarian used a Happy to copy disks for
members. Because of volume, he naturally used high speed. Frequently the
copies were unusable due to errors similar to those you describe.

I suggest, if possible, you use a different drive. This would be the
technique most likely to succeed. If you only have the one, try this:

a. disable Happy high speed - I believe just cold starting it will do the
trick (don't have one);

b. boot Sparta or MYDOS on the 256xl for maximum RD size;

c. copy the DCM file to the RD which must not be set up as D1: for use with
DiskComm;

d. run/load DiskComm and answer N to the 130xe RAM query;

e. change your source drive to the RD number and leave the destination as
D1: in single density (DiskComm will reset density automatically if
required);

f. start the file to disk conversion; and

g. when asked if you want to format the destination, answer N to any high speed sector skew query, otherwise DiskComm will reenable high speed write.

If the 256xl is not available, the same general procedure would apply except that you'd be doing D1: to D1: disk swapping (groan), and be free to use 130xe RAM if available.

Choice of DOS is not a factor as far as errors go since DiskComm uses its Own disk write routines with high speed support for US Doubler/Archiver, XF551, and Happy. I use the above RD technique with Sparta and it probably works with MYDOS as Bob Puff is co-author of the DOS.

I don't recommend DOS 2.5 because its RD is not large enough to hold a single density disk and, in any case, i.e. modified RD, cannot handle sectors past 1023. I've unDiskCommed files that produced DOS 2.5 enhanced density disks with 0 free sectors. As DiskComm needs extra sectors for, I assume, a sector map, you couldn't fit such a file onto any DOS 2.5 disk or RD.

If the above solves the problem, it would be a good idea not to use the drive in high speed for anything and, definitely, to look for another drive.

Good luck and greetings from Victoria, Canada

John Picken

3737. MIO strangeness...

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-10 03:33:40 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01HEIP8C79WI8WZ8N1@vax.edinboro.edu>
Source record: 99915

I was playing around with my 1 meg MIO today and things are really strange.
It works just perfectly with everything.... except SpartaDOS X. This is
what happens:

MIO and SD3.2g: No noticible problems. Ramdisks seem OK.

MIO and SDX: Does not even boot. Sometimes the screen does strange
things like flickering and random lines. Occationaly
I get symbol flag errors.

MIO, SDX into RT8: Seems to work just fine. The SDX format menu flickers
like crazy, but there are no other symptoms. RamDisks OK.

MIO, RT8 into SDX: Boots, but then I get a bubch of symbol not defined errors
and config.sys errors.

MIO, ACTION! into SDX into RT8: Works almost normally. I get a slight
intermitant flicker with format, but nothing
else.

I can't figure out why the MIO seems to work with my computer just fine by
itself but does really strange things with the SDX cart plugged in. Plus,
It seems as if the more Carts I have plugged in the better it works. It
Also works fine with no cart or with any game cart. Also... All of this
seems to have started when I put a second Pokey (gumby upgrade) in my 800xl.
I've even tried powering the computer with a 23A PC power supply, just to
make sure it was not a low power.

Is there a possibility that the gumby upgrade is somehow affecting the power
draw of the system in some way that plugging in a cart would produce problems?
And then by adding more carts (and increasing the buss power draw) that the
power would stabelize?? I know it sounds crazy, but I can't think of anything
else.... and I do not have another Atari w/ a PBI to test things on....

H E L P ! ! ! !

-Adam Conover.
a644690c@edinboro.edu

thanks....

>and run it in emulation". Anyone with a machine fast enough to run PC

An emulator says "look at all the great programs there are for
8-bit Ataris!". Why should someone who has invested in a fast
pc have to buy other hardware if his current is powerful
enough to use an emulator? Which also happens to add handy
improvements such as much faster disk access, being able to
use a decent monitor, easy BASIC on/off switching and running
faster than any 8-bit ever will.

>Xformer will not be the type or person likely to want to follow the path
>FTE is going to blaze with the real thing. As such in a way it is a
>threat to FTE's "this is our last chance to power charge our 8-bits" project.
>
>I like having an emulator waiting for me as a means of immortality for
>the 8-bit, but I wouldn't want everyone to switch over to emulators right
>now. Not until all developers go under and things are TRULY over.
>
I love my 320k 600xl with dual OS and Happy 1050 dearly. But
I'm past the point of wanting to upgrade it. My 5.25 disks
are rotting, and I can now transfer them to a safe hard disk
and use them easily. If Xformer 3.0 keeps the promise of
sound and XL emulation, I'll have a convenient platform for
M.U.L.E. or Archon or Rescue on Fractulas or one of the
countless other little gems written for my beloved computer.
And it won't matter to me that it is not running on the real
thing. FTE's thing ain't an original Atari either, is it? So
my money goes to a pc clone maker and not to them. At least I
won't have to wait because they're already quite abundant.

I think emulation is a good way to go for the fantastic Atari software base, and although I agree that the creation of a specific comp.emulators.atari would be a good idea I see no reason to shut XF2 conversation out of here. The name is this newsgroup doesn't imply this is strictly for people who happen to still use 6502 hardware.

Regards, Michiel

>We're discussing Atari, not emulators.
>This is the future of the Atari 8-bitters, like it or not.

I disagree, this isn't the future, the future is folks like John Harris...
programers who write the software that let us use the new hardware thats
coming on the market. The future is FTe and hardware like the Mars8 board,
the ColorGenlock and the R:P: interface. Things that keep our systems as
much up to date as possible. The future is not running a static copy of our
machines with in an MsDOS system, the 8bit's future is in expanding what this
little machine is able to do...Just a year ago "They" said Zmodem of any kind
was imposible on the 8bit...Thankyou Larry Black for Atzmodem! Just a few
years ago "They" said the 8bit could never handle QWK offline reading...
Thankyou Pab Sungenis, Bobby Clark, Robert Stout, and several others...
And who would have ever thought the good 'ol Classic 8bit could run a Term
program at 14.4 w/o need of flowcontrol...Thanks E.Hallwell for the upcoming
FlickerTerm 80.

PC-Xformer is a tool we can use to exploit our choosen systems...If you want
to talk about PCXF, fine do so...if on the other hand you'd rather waste your
own time and ours "Flamming", please don't....

As you say in the first quoted line, "We're discussing Atari, not emulators."
Lets talk Atari...we don't need "Flammers"

>>and run it in emulation". Anyone with a machine fast enough to run PC

Again, I disagee with the above line. For some reason I'm getting the idea
that a number of folk believe that the only reason some of us still use the
Classic 8bit at all is because we can't afford to upgrade to a PC...PCXF is
not a threat...it's just another tool that we can use to exploit our systems,
recall John Harris's post. Still, I can't speak for others but I've gotten
my Mac's, MsDOS machines (386 & 486), NeXT and will likely get a PowerPC too.
And I still use the Classic 8bit because I can... I choose too, it's what I
enjoy doing and as good as PCXF 3.0 may end up being, it'll never replace
the enjoyment I get making a 1.79mh machine do things no-one thought was
possible.

You don't want to support FTe and the new AC, fine. You just want to move
and play classic games on you MsDOS machine, Cool! But I've never seen the
need for all this "Flaming" that's been going on...

3741. Need for a good spreadsheet

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-10 05:53:47 UTC
From: krishna@max.tiac.net
Message-ID: <2vo2db$620@sundog.tiac.net>
Source record: 99918

A while back I went on a quest for a good spreadsheet.

I came up woefully disappointed.

Syncalc is not convenient to use with the hard drive. Also, it's commands take far too many keystrokes IMO. It also doesn't have some features I saw when I took a small workshop class in Lotus 1-2-3. Notably dealing with time/date functions and some other stuff.

Bcalc is okay but it's still limited.

I tried some others and they all had some archaicness to them.

They ALL have a serious lack of vertical bandwidth.

They have TONS of horizontal bandwidth.

Now, for maintaining a checkbook? Bcalc is fine.

But I have a large collection of comic books I'd like to catalog. It's not a database situation here, because their values fluctuate and I'd want an updated total and a nice inventory printout.

It's really sad that there isn't a standout spreadsheet for the Atari that will see much in the way of upgraded RAM and also be friendly to the hard drive. If anyone knows of such a program, let me know. Isn't there a TurboCalc as well as TurboFile? I know the Turbo series is compatible with hard drives and Sparta.

As for databases, I know a lot of people rag on Diskbase for being spartan, but it is MORE than adequate. Its ability to print to disk allows you to format and print data with TextPRO macros or other report programs. Diskbase is fine for me.

But I think the gap in the spreadsheet domain is profound. It is at least as much of a gap as the "high speed vt100 terminal" gap was before FlickerTerm came around. Unfortunately I bet a spreadsheet is much harder to code than a terminal so I fear this problem will not be alleviated.

In as much as I am looking forward to what FTE is doing, unless we can get programmers to work on SERIOUS application programs the 8-bit will continue to be stuck in a straightjacket dealing with programs which WON'T or CAN'T access all the extended memory or modern peripherals.

It only takes ONE good spreadsheet just as it only takes ONE database program to make the 8-bit competent in that area.

All I can say is I'd pay a good $50 for a commercial spreadsheet program which could do the following:

Work with Sparta or MYDOS hard drives. Launchable off DUP.SYS or the CLI from any drive or subdirectory.

Accesses any upgraded XL/XE, using a data file to customize the banking bit assignments for your paticular upgrade as well as several files coming with the disk premade for varous upgrades. All the way up to 4 megabytes.

Ability to sort lines alphabetically (good for inventories like comics)

Ability to print a report to disk or printer. The ability to format the printout in standard, condensed, or sideways. The ability to input and output in DIF format for conversion to<>from IBM standards.

The ability to add up time as well as decimal figures (useful in payroll) and time formatting as well as monetary formatting.

The ability to link sheets together so that the output total of one sheet is used by another sheet. This could be used by a sheet that takes a lot of monthly reports and comes up with a yearly average, etc..

(this ability of linking sheets could be a cheat if memory management for Banked RAM is not developed)

Also the ability to run using the block move opcodes in the 65816 for increased speed.

How many people would put their money up for a program like this? If enough people express interest maybe someone will give it a shot.

3742. Re: 8-bit Atari Emulator discussion

Newsgroup: comp.sys.atari.8bit

I hereby throw my two cents' worth into this discussion, heavily on the side of keeping XF2 discussions HERE. With a dismissive handwave, I'll just say that I agree with ALL of the reasons previously given here as to why the discussion should stay. I would point out that XF2-related messages could be CROSSPOSTED to c.e.m. if the need were felt.

I found it interesting too that the analogy was made to the 65816-board discussion. Once you start picking apart ALL possible places a topic COULD be discussed, the process of deciding where to look for information explodes in your face. Should a discussion of displaying GIF images on the Atari 8-bit appear in c.s.a.8, or over in comp.graphics, or in some CompuServe-specific forum? Should discussions of file-transfer between an Atari 800XL and an Amiga 1000 be discussed in c.s.a.8, c.s.amiga.<somewhere>, or comp.dcom.datacom? If I have a piece of paper that tells where to FTP Amiga ports of classic Atari games, should I file it under Amiga, FTP, Atari, Games, Things To Do, or somewhere else? It's indeed possible to get SO wrapped up in this sort of trouble that you end up NEVER filing/posting ANYWHERE, which is not only a loss to the community at large, but something of a neurosis on the part of the individual. So let's spare ourselves a meta-discussion of what we should discuss, and get back to discussing it!

Chris

3743. "XF2 FAQ" aka the Unofficial Newbie/Emulator-users/etc Atari 8bit FAQ

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-10 07:00:10 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940710000018.2380527e@sonoma.edu>
Source record: 99919

I am WAY too tired (and lacking in new questions) to add anything to the FAQ, but it WILL be posted on c.e.m from now on, and every new revision, I'll put a note about it up here on c.s.a.8. Hopefully, my FAQ will be noted in the official c.s.a.8 FAQ and will be up at FTP sites so newbies can FIND it! :)

Thanx go to Ted Skrecky for posting the clock (TIME$) PAL/NTSC fix for the TurboBASIC XL RUNTIME package (and for fixing the TurboBASIC XL language interpreter long ago)!

When I get a working version of it, I will put it on the archives (if it's not already there)

thanx again, ted!

[1] Re: Argh! Emulator Discussion Sinks!

Earlier, Marc Sasiadek <U24226@uicvm.uic.edu> said:

[snip]
> We're discussing Atari, not emulators.

Actually, most of the posts which are annoying other c.s.a.8 readers
do NOT have to do specifically with Atari, rather, specifically with
the emulator, formatting drives on it, getting it to load, etc.
I feel from now on all questions like that should be answered with:
"READ THE NEWBIE/EMULATOR FAQ!" <grin>

> This is the future of the Atari 8-bitters, like it or not.

This is ONE of the futures of the Atari 8-bits. There's the MARS8
which sounds incredible. It requires an Atari 800XL. NOT an Atari 800XL
emulator, but the actual motherboard (unless some less-plug-in-y version
comes out which uses ribbon cables, as mentioned in this group a while
ago by Glenn Saunders I believe).

> Change is easy, but deciding to change is the difficult part, at least
> for you. Do you realize the potential of this emulator? Given the
> right hardware and software you can have multiple Atari 8-bit
> programs running simultaneously. We're talking full pre-emptive multi-
> talking of the Atari OS, Atari DOS, and 8-bit software.

This exact thing was discussed and proposed with the Atari 130XEC. Have
you heard of THAT? It was the other Atari emulator which would've came
out a few years ago. Using 640 x 480 x 256 you'd get 4 Atari's going
at once. It never came out and I believe the project died.

> You must use a computer besides an Atari 8-bitter.
> Don't tell me your main computer is 130XE wih a black box.
> You're telling me you have no use whatsoever for this emulator or it's
> future versions? We're talking about progress here. There hasn't been
> any progress for the 8-bitters in a long time.

Up until my Senior year of high-school the only computer I used was my
Atari 1200xl with an Atari 1050 and XMM801 printer. Eventually I got an
SX212 modem, another disk drive, and a ton of files (which I never knew
existed). I had never used an IBM before. I had played with Mac's a
little when they first came out and thought they were keen. BTW, my
Senior year of high-school was 1992-1993. So all that time I had been
running all my computing 'stuff' on my 1200xl with 64k RAM. Now I have
256k RAM, my friend's IBM PS/2 (crappy machine) which I use SIO2PC on.
I would never use XF2 on it for the following reasons:

1) I have a 1200xl right here
2) It doesn't run on 8086's like this PS/2
3) Even if it did, it'd be hideously slow.. to me, a downgrade.

Don't get me wrong! I'm all for the emulator, remember, I WROTE the Newbie/Emulator FAQ file (last night in fact) and have gotten a few comments on what needs to be changed and (thank god!) some praise about it :) .. I understand the potential of the emulators, keeping the Ataris alive long after the hardware dies. But still, the emulator at this stage is (again) a downgrade to ANYONE except perhaps stock 400 users.. and MAYBE stock 600xl users.

As for "no progress".. how can you account for this dip in the bucket?
APACView (I know old)
ColorView (ditto)
JView
Ice-T
FlickerTerm
some of the cooler demos
MARS8
SIO2PC (also a little aged now)

So, as you can see, I agree with you, but in a very disagreeing way :)

have fun
keep your hardware

Gee, like the quality content of YOUR enlightened post? :) I'm not defending the content of the emulation questions, just their right to be here. XF2 is new and will have this "learning curve" of silly redundant posts. Eventually, the FAQ will take care of newbies. Maybe what we need is to petetion for comp.sys.atari.8bit.emulation. This would clear the boundaries of what goes where. I'm sure the general emulation groups won't entertain much 8-bit talk.

3749. Mars8 idea

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-10 17:52:08 UTC
From: krishna@max.tiac.net
Message-ID: <2vpcg8$kgh@sundog.tiac.net>
Source record: 99926

I don't believe I posted this, but since Bill Kendrick mentioned it, I might as well let my idea became public.

The notion is to run ribbon cables from the MARS8 daughterboard to the sockets on any XL/XE motherboard. This would let you use MARS8 with any 8-bit. The problem here is 3 fold:

A) The length of the ribbon cable may be too long to keep operations reliable.

B) Since MARS8 is for the 800XL, the upgrade probably does some kind of thing to mimick the Freddie which the 800XL lacks, thus making the upgrade possibly not work right with an XE unit. But it would still work with the 1200XL (which is my main reason to want this).

C) It might be kinda bulky with the ribbon cables crisscrossing.

If someone "in the know" could let us know if this might be a possibility, I'd appreciate it. I don't see why MARS8 wouldn't work on a 1200XL (converted to XL/XE compatibility of course w/internal Basic) as long as it could FIT.

Count my money in!

What about the rumor that the rights to SynCalc were being renegotiated?
If an existing spreadsheet could be enhanced, this would certainly be the
one of choice. SynCalc is still a very nice piece of software.

Yep, A is single density, B is real double, and C is enhanced. Normally
the drive can change modes automatically. Who remembers how to do it
manually? I know you hold one button down while pressing the next button
to the right, I just don't happen to remember which buttons the two are. :)

"Surely the copyright restrictions on the software can't
be valid (considering their age) and..."

Copyrights are much longer than most people seem to believe. IMO, for software, they are much longer than they need be. In the United States, Copyrights for "work-for-hire" are 75 years from date of creation, and copyrights by individuals are good for the life of the individual + 50 years. I suspect the laws in Australia are very similar.

This is true for any item copyrighted since the beginning of 1978, which covers *almost* all personal computer software, and certainly any for the Atari 8-bit.

In a message dated 7-9-94, James King said:

"Who was it that suggested that all SERIOUS 8bitters would
simply wander off if these discussions didnt mellow?"

That might have been me. I speculated in one message that the reason comp.sys.cbm did not see a drastic drop in message trafffic when the C64 emulator talk got its own newsgroup was because many peole who had "tuned out" the group due to the emulator talk tuned back in when it disappeared.

I am starting to get a case of deja vu here. I see the same arguments used by emulator users as by those in comp.sys.cbm, and even the beginnings of emulator-specific threads.

Just as with comp.sys.cbm, I will not drop reading the group, but I will not like it, either. I understand the reasons for your decision, but am sorry to see you go. Perhaps we "hardware" Atari 8-bitters could do an RFD for "comp.sys.atari8.bit.nonemulated". <grin>

AGES ago! I ran a BBS called GREKELCOM in Oklahoma City for
several years with some success. Nice thing was, it was
hackable, since it was written in BASIC with some ML subroutines.
'course, back in The Early Days, we didn't have anything fancy
like "error checking" or "transfer protocols." :-)
No, we had to DOUBLE the length of binary files by converting
them to ASCII files and then transferring them by just
capturing the data stream. jeez.

Just before I shut the BBS down I converted it into a
"futuristic" BBS I called The Mercury Theatre BBS. When
logging on, it gave the impression you'd shot forward about 20
years to the time when The Net Police were cracking down on
renegade BBS systems (presumably Mercury was one of these
non-authorized boards). Of course, it was "classics week"
on the BBS, and the files were 8-bit programs from "way back
in the '80s", and if you stayed on line long enough, the
BBS would kick you off as if The Net Police had tracked the
line and intercepted the call. It was a lot of fun to
put together, and I hope I freaked a few people out... ;-)

ARMUDIC was surpassed by AMIS and other BBS programs, but it
served me well... <snif>

> this and still even RUN on a 286!?

Actually, the IBM is not quite fast enough...even a 486 running a 33Mhz can be
bogged down. Darek's emulator skips some time consuming graphics functions
like vertical scrolling to speed things up. Character graphics are the
slowest graphics modes because the character data must be read every
horizontal scan line to be 100% compatible. This is very time consuming and
would make the emulator sluggish. Next time you run XF2 notice that sometimes
the character graphics are not updated properly (try montezuma's revenge).

> Also, what's so hard about emulating 800xl that makes all of these emulators do
> only 800 (for the moment) !?!? The only diffs. >I< know of are XL OS's are a
> bit more efficient, can swap out of memory, and have self-test ;)

For an emulator, there is no advantage in emulating the 800xl over the 800.
All programs are already compatible with the 800. Most 800xl users load
the translator or use a ram disk so the extra memory is tied up anyway.
Since all emulated disks drives are ram drives anyway, there is no need
to have a ram disk on an emulator.

> (I think I should read over the XF2 docs, I've got so many questions nowadays,

> -bill
> kendrick@vax.sonoma.edu |||
> New Breed Software / | \

BTW, I starting writing an emulator about a month before Darek released his
very competent emulator. I had the emulator up and running in the text
mode when Darek released his program. I orginally wrote the emulator in
Borland c++, then rewrote the entire program in assembler. Anyway, now
that Darek has released his program, I have no plans to complete my version.
If anyone is interested in looking at the source code for an atari emulator,
I would be willing to upload the source code. If anyone wants to try and
finish the emulator, also let me know... I will have to update the
documentation. (I wrote the documentation before I wrote any code. So the
documention does not necessarily reflect the current program.)

Also, I was also writing a program that can read and write to the atari
SIO peripherals using the IBM parallel port. Currently, I can read and write

to my xf551 atari disk drive. The user must build a simple cable that connects the atari peripheral SIO to the IBM parallel port. (The atari computer does not have to be connected.) I was going to use this with my atari emulator to run copy protected disks. The program runs on my 486DX-33Mhz computer, but will not run on my 286-12Mhz machine. The timing is rather critical and this software may not even work on another 486DX-33 machine, but I will post the source code for this program too if anyone is interested.

Post to this group; do not reply or email me directly, thanks.

Mike Munoz

It probably means something along the lines of "enough requests to make
it worth my while to port Xformer." Which means that if three people
ask, it probably won't happen. But if three thousand people ask, it might
happen.

Personally, I wish it would happen. :)

Regarding Turbocalc. It is not a part of the Micromiser software
Turboword, Turbofile, and Turbobase series, but rather is a part of
Chuck Steinman's (Dataque) Turbo816, Turboassem, series.
It was basically a rewrite of Bcalc, using more drop down menus but
including quick key command support. It would run on any machine, and
was contained on a cartridge. However, IF you had a 65816 via Dataque's
Turbo816 card, and IF you had a TurboRAM Ram expansion card plugged onto the
Turbo816's expansion connector, you could use the 65816 expanded memory for
spread sheet use.

I don't use it because it's cartridge based. I already hate having to
switch between MAC/65 and Action and BASIC XL for various things.
For me, cartridges aren't a good idea, and I can't wait for the release
of the MARS8 card, so that I don't have to switch cartrides anymore.

You're calling for some pretty fancy features there. I agree something
newer and better would be nice, but realistically, I don't see anyone
able, or able & willing to take up the task.

Jeff

RE: XF2: Another View

I have a problem with your response, Ben. I do not deny your right to feel that this does not belong in this newsgroup, but it seems that you are contributing to yet another polarization within the Atari community (I'LL use the word, even if you are reluctant). I think both sides of this issue can stand to be a bit more tolerant. I worry that you'll get angry and go away when you are one of the people we can least afford to alienate.

I would personally like to see this sort of discussion happen on a newsgroup set aside specifically for Atari emulators, but until that happens there WILL be quite a bit of confusion as to the most appropriate place to hold such discussions, with both c.s.a.8 and the misc emulators groups seeming reasonable to different folks. Let's PLEASE not tear ourselves apart over something like this. We need to be supporting each other, not finding new arguments.

I know you asked that this be posted back to the newsgroup, but my software here is currently screwed up and makes that very difficult. Besides, I consider this more of a personal appeal to you as one of the most influential 8-bitters than as further public thrashing. You have my permission to post this back to the newsgroup for further discussion if you wish.

3769. HELLO, COMP.SYS.ATARI.8BIT (I HOPE!!)

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-11 21:26:51 UTC
From: Andy_Floyd@f629.n157.z1.gatenod.aldhfn.org
Message-ID: <1994Jul11.01208.350009@f629.n157.z1.gatenod.aldhfn.org>
Source record: 99944

Last time the address for Internet was missing a few chars... <g>
Anyway... I would like to say that if this gets to where I want it to
go, I would like to voice some of my disappointment with AC in regard
to articles submitted. Ben said something with regard to submitted articles...
Well, darn it, if the editors for the various sections were doing their
jobs in that capacity in addition to writing their own pieces, then MY
submission of "Cross Stitching Your Atari" which, indicated by the list
inside the front cover, was sent to the Graphics editor Jeff Potter. Jeff
either never got it (I never got any acknowledgement he got it) or he
promptly lost or ignored it. This is not anything against Jeff - it is
my beef with the submission structure. I feel that it should have been
sent to Ben instead. (BTW I sent it last year at about this time or a
month or so later...)
If the editor had received it, he could have made the supreme decision
for either getting it printed or declining. Instead, I sent it off the
the Graphics editor (since the program I wrote deals with graphics) and
nothing more was heard. I followed every single painstaking detail to
make sure it would be printed.
After all, Cross Stitching Your Atari will take MicroPainter or MicroIllustrator
(Koala) pics and print a 4 page cross stitching grid pattern - compared
to $150 and thereabouts for similar software on non-Atari 8-bit machines,
even if they do allow design of the actual pattern, colors, backstitching
and diagonal stitches.. But take my CSYA and a paint program and you have
a very close equivalent. (Nothing yet gor for Graphics 8 screens..)
So.. Anyone willing to take a shareware unregistered version of "Cross
Stitching Your Atari" and either speeding up the print loop with an ML
subroutine or releasing it as it is now (I'm currently working so time
is at a premium), please reply. I would like to see this get out and perhaps
stir up interest in the Atari 8-bit.
I can't wait for the Aug 7 CAIN show in Kirtland, OH. Heck, I want a
GENlock device and write some subtitling software for my Ranma 1/2 and
Dirty Pair TV episodes (once I get the scripts...!)
I also write for The 2600 Connection, Jeff's Atari Outpost, and my usergroup
newsletter.
Just my 8-bits' worth... ANDY FLOYD

Source record: 99952

Hola mundo.

The following are some questions from me that never got a reply:

- Is there a RAMDISK.COM for DOS 2.5 that can handle more than
499 free sectors, or 2 or 3 ramdisks in a 256K 8bit?

- What is the 65816 (is that the number?) processor?

- What is MARS8?

- Which is the current version number of MyDOS (Bill Kendrick told me
about 4.53/4), TurboBasic XL, MAC65, etc...

- Is there a hacked version of MAC65 for DOS 2.5 ?

- Which kind of power supply is required for the 830 Acoustic Modem?

- Is there a ftp location other than the atari.archive from where
I can get more games/utilities/misc, even cracked?
(I know about some PC sites where games and other stuff are stored
for some weeks. Also some troyan horses and viruses!!!)

I'm sorry for being insistent, but... ;-)

If any of this questions was previously answered through the
newsgroup, I guess that the post lost somewhere.
My news server is quite "far" from the rest of the world.

Please reply through e-mail... Thanks...

Bye... ++Vitoco

Message-ID: <1994Jul11.181852.20544@wariat.UUCP>
Source record: 99951

This talk about spreadsheets. I tried SynCalc and still have it, but
did not like it (can't remember why). I used VisiCalc for two years
and I still have no IBM spreadsheet I like better. It is limited in
that it only uses single density DOS 2 type disks. But I wonder why
someone wanting to do the comic book spreadsheet wouldn't want to try
the 'file' version of VisiCalc on a small partition on the hard drive.
Of course, it wouldn't be much good to use VisiCalc without the
outstanding documentation (I mean own a legit version.) It still is
available, I've seen it at American Tech or B & C or someplace.

3774. Re: ARGH! Blah blah blah :)

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-11 22:38:16 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940711153821.2380610e@sonoma.edu>
Source record: 99947

Bob Lange made a few posts about the emulator and such, and, although it probably wasn't all aimed at ME! :) it did seem a little aimed towards me :)

Ok, I've had my 1200xl for about 11 or 12 years. I had NO access to the Atari community. In 1987 I found about 2 or three kids in my school who had Ataris and shared a little software (AND I MEAN A LITTLE!) I had to write my own word processors to work on my XMM801 printer. I had almost no books, no commercial software, and what hardware I got, my dad purchased for me. So I think I'm the ORIGINAL 'closet' 8-bitter! ;) I wrote EVERYTHING IN BASIC! <cry> I even wrote a better version of BASIC >IN< BASIC (from learning Pascal in 1990-1991, I decided standard Atari BASIC sucks so I made a program which read in a text file and converted my new commands and syntax into regular Atari BASIC. <sigh> If only I knew that 5 years before there already was such a thing: read: TurboBASIC XL! :))

Anyways, I had ALWAYS thought of Atari's as being dead.. then I found those kids with software.. then I thought it was dead again.. then my disk drive broke so I got it fixed and got a modem too.. YIKES! ATARI 8-BIT STUFF!!! WOW! (phone bill jumps to about $500 a month) (there went my summer job's earnings!) Then I figured "well, it is sorta dead anyways, I mean, it's all old software".. then I found Internet... WOW! IT'S ALIVE AGAIN!.. And in my eyes, it has stayed that way.. With advances in software such as ColorView and all of it's derivitives (FlickerTerm, the Wall, etc), and all of the AWESOME AWESOME AWESOME stuff I see in demos (yeah, I know, demo's.. you either love them or you hate them.. i love them) I know that the platform is not the wimpy thing that "non-believers" think it is. By non-believers, I mean folks who have never actually used an Atari, or used it when they were young back in 1984 and then got their "wonderful" IBM.. When they finally see it, then they think for a second.. hehe, then they show me some fantastic IBM demo and I crawl back into my hole (then another Atari demo comes out which does the same damned thing and I feel better again! :))

Ok, babble babble babble.. what was I going to say? Oh yeah, as for what >I< think about the emulator... it IS wonderful! I love it! I begged and begged my friend to let me come over to his house and mess with it on his 486/33. I finally did... it brought him back a few years, I can tell you that! :)

BUT.. I have to disagree that it is the ONLY "future" of the Atari.. sure, I can foresee the Atari 8-bit hardware all finally giving up and turning into scrap-metal/plastic, but I'm not exactly sure that'll even happen in my lifetime.. maybe.. (ok, so it will :)) The thing is, like I said, it is not CURRENTLY, the >ONLY< future.. The current hardware DOES have a future, as it always had (in the Black Box and the MUX, for example, and now with the Mars8).

So you see, I DO agree that the emulator 'slammers' seem a BIT too upset. I'll take this moment to mention I HAVE POSTED REVISION 0.1 OF THE EMULATOR/NEWBIE

FAQ FILE ON COMP.EMULATORS.MISC!!! (and it's about 2x bigger than 0.0).
But on the other hand, some of the people here (like the person who said the emulator is the ONLY future) are also being a bit big-headed about their opinions..

Anyways, I have no idea how to end this other than noticing (like everyone else): "wow, sure is a lot a posts around here, huh?"

I just got ahold of an Atari Assembler/Editor cartridge without any manuals. I have managed to figure out how to get a program to compile without any errors, but I don't know how the debugger works.

I was wondering if someone could post a short key summary on how to use this cartridge. I would really appreciate it. (If this is in a FAQ or on a FTP site somewhere, pointing me in the right direction is just as good.)

What programs do you run? The only ones I know of that won't run on
an XL are some old games, but there are many very useful programs
which either require or just take advantage of the extras found in the
XL/XE machines, and not merely for ramdisks. Off the top of my head:
SpartaDOS, PaperClip XE, AtariWriter+, Textpro.... many others.
Useful things, not games.

The original 400/800 were released around 1979, and the XLs (beginning
with the 1200XL) were released beginning around '82, giving only about
3 years of exclusively 400/800 software (most of which does run on
XLs). The 8-bit were discontinued around 5 or 6 years later, and
people still continued writing software for them. The 800XL was the
most popular of the bunch, so almost everything runs on it, and a lot
of software was designed _primarily_ for the 800XL (and the 130XE). I
GUARANTEE that more software runs on the 800XL than on the 800.

There aren't 3000 8-bitters in the US (at least not on the net). If he
posted the same on the Amiga and other newsgroups maybe ex-8bitters exist
in enough numbers. But he won't get enough from 8-bitters.

You forget that the 800XL is 64K. Some games require that extra 16K.
There ARE advantages in emulating the XL/XE over the 800.

I don't think you know much about the 8-bit scene, no offense.

The Once and Future hope of the 8-bit Atari.

16-bit internal. 24-bit address bus. Backwards compatible with the 6502 for the most part. Different pinout from the 6502C in the Atari's so that a conversion board is necessary. Chuck Steinman made one but he never really "made it happen" in a serious way.

There is always hope that we might get another 816 system presented a little better than Chuck of DataQue presented it.

The whole point to the comic book stuff is getting a running tally of the current value of my entire collection. It requires far more memory than Visicalc can hold, or any other spreadsheet I have encountered. Splitting up my collection into several sheets would be a major pain in the ass, and I'd also want to be able to insert new acquisitions and sort alphabetically by title. I know there are a couple business programs which deal with INVENTORIES and that is really more like what this is, but I don't know how they handle large inventories. SBM and such...

I have no trouble balancing my checkbook with a 64K spreadsheet, but not for this.

I think Syncalc will recognize an Axlon upgrade but not XL/XE. At least the version _I_ have doesn't. Like Paperclip, there is a physical limit based on the fact that you are saving to floppies so obviously it can't support more than 80K or so at best. Paperclp can save to DD so that is a 180K limit (less than its inner 256K capacity). Pretty limiting programming :(

Actually, for SpartaDos users, (X-cart in particular), there was a patch
available on GEnie a few years ago that would turn the disk into a .COM
file. You then had double density support, along with hard drive support.
I used my copy with the X-cart for a number of years with no problems.
Never did get it working with Sparta 3.2d, but didn't spend much time
working on it. Supposedly, it worked with 3.2. Learning Visicalc made my
switch to Windows based spreads kinda like having a really GREAT dessert!

I'm not so sure about that. I'm sure that there aren't 3,000 people who
use 8-bit Ataris as a _primary_ computer, but I'm sure there's at least
that many who use it as a sort of recreational computer. I've got a Mac
IIci as my front-line system, followed by a 1040ST and then my 800XL. I'd
love to see an 8-bit Atari emulator for my Mac. :)

>titles will breathe badly needed life into the 8 bit scene.

It depends on your definition of "life." On the one hand, the above plan would have eight zillion people playing classic 8-bit games on their top of the line PCs--my guess is that such an archive would be very popular. But this would effectively be the last hurrah for the 8-bit machines. No one would want to sell old software or (rare though it may be) write new stuff.

I think one of the few things keeping the 8-bits alive is the the rebel "getting by with less, not caving into the popular computer mentality" attitude. Absorbing that into the generic mass market of dime-a-dozen PCs isn't going to sit well with a lof of people, possibly. Well, with me anyway.

Message-ID: <199407120608.AA062233330@relay2.geis.com>
Source record: 99862

Adam,

You deserve credit for the way you reported the anomalies you observed with the MIO & various ICD/OSS carts. I've heard vague reports of instability involving the MIO, but yours was the first concrete evidence I've seen.

I highly recommend this information be immediately given to Mike Hohman at FTE, since he's the "ICD Guy" now.

I don't have an immediate explanation, but I suspect a ROM bug. What version ROM do you have in your MIO?

I seriously doubt the problem is in your supply bus. If so, it would grow linearly *worse* with each additional cart you stacked on. Instead, you had at least one condition where the addition of the extra cart load seemd to to smoothe things out. Plus you had anomalies just by switching the same carts around in different order, which makes no difference whatever to the supply (a load is a load). This is almost certainly a firmware problem.

Please reply to the newsgroup, so everyone can see what develops here. This is one of those mysterious problems that ICD attempted to suppress rather than fix.

I have a 1-meg ROM v 1.1m (1987). Is this the same ROM you got?

3796. XF2: ANOTHER VIEW

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-12 06:16:20 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407120615.AA068933750@relay2.geis.com>
Source record: 99863

Responding to Jerry Dunham's comments on my negative view of the XF2 postings:

Of course I must begin by pointing out that I'm entitled to an opinion just like anyone else. Unlike Bob Puff, I have no ambitions toward sainthood & have been known to get "down & dirty" in this forum from time to time. I've even been known to *want* to bug people from time to time. There's nothing more frustrating than trying to bug people & they don't get bugged. My main frustration in this case is that Jerry seems the only person in this group who cares enough to be disturbed by my comments.

My comments were intended as a mild riposte toward the recent flood of XF2 chatter here, which quite frankly I find boring/mildly annoying. However I must admit I am caught off-guard by the rapidity with which this thing has heated up & am generally in sympathy with Jerry's plea for the adoption of some degree of moderation in the emotional levels.

Someone suggested the interest in the emulator topic was mostly on the part of old-timers (10+ years users). I'd like to disprove that theory by counterexample: I'm an 11-year user who also has a roomfull of PC-thingies, but I have no interest in 8-bit emulators whatever. I believe there are enough folks like me to render the assumption false. If I want to use my 8-bit, then by golly I'll use the real thing not an emulator. To me, the PC is something to use when the software I need doesn't exist for the 8-bit. I didn't intend we should shut out emulator discussions in this group completely, but I think the complaints have centered on the fact that recently they've been rather excessive. Fundamentally the complaints are directed toward restoring some sense of balance-- which was also the intention of my complaint.

Michael Current's suggestion was a step in the right direction, but I think impractical. Human nature being what it is, people are just going to post wherever they please & not bother to categorize their response beforehand & post it to the proper group (assuming I understood that right). Adding an emulator section to the FAQ is an excellent idea. At least then us grumblers can say "Hey doofus, read the FAQ!" whenever someone posts an emulator question that's already been hashed over a hundred times.

People need not worry that I'll really get pissed over this issue & leave the group. I was extrapolating the situation to the extreme to suggest what might happen in the worst case. Compared to the volume & viciousness of the "hate-mail" I received in the wake of the demise of AC, this little XF2 thing is a tempest in a teapot.

My perspective on things is radically different from what I see happening in this group. I would trade all the emulators in the world for a few useful

upgrades to BobTerm (a reliable VT-100 emulator, addition of KERMIT protocol, and multi-screen buffer for 8-bits with expanded memory), or just one decent schematic-drawing program. It grieves me to see a talent like Darek's being squandered on emulator programming when there are so many software needs unfilled for the original hardware. (A purely selfish attitude, I admit.) Of course poor Darek has always been a misguided fellow, I fear that Microsoft place he works at is a bad influence on him. (If that statement doesn't get me a flame, nothing will! :) Howdy-do, Darek!)

My facetious comment on the word "community" was intentional. 2 or 3 years ago I felt a sense of community here. Now that element seems missing. Maybe the group has changed. If so, I think for the worse. Or maybe it's me that has changed, I don't know. But something is different now, that is certain. I don't think my postings carry all that much influence here any more, many of my postings lately seem to be ignored (except when I'm offering deals on desirable hardware). That Jerry Dunham was the only person who picked up on my sarcasm is illustrative. A few years ago a comment like that would have brought down a storm upon me. Today, it goes by unchallenged except by one person. Q.E.D.

- Ben Poehland

PS- Please post responses to the group, not to me.

3797. 130XE DOODADS!!!!

---====== 130XE DOODADS FOR SALE ====---

I got a nice 130XE, new in the box with all original packaging/cables/manual/
power supply etc., $65 including shipping.

I got another 130XE, excellent condition, complete accessories but manual is
for a 65XE not a 130XE (well geeze they're *almost* the same!), $45 including
shipping.

DOODADS!!!! (prices include shipping in USA)

1.) 2 dust covers for above machines, $10 each. One cover is deluxe & will
go with the pristine unit. The other cover has "65XE" on it but fits
just fine, will go with the 2nd unit.

2.) Newell 1-meg board for XE (just one)..... $25
Set of 8 1-meg chips for Newell board.... $25

3.) Two "TT-Touch" keyboard upgrades for XE... $10 each.

US buyers preferred. Will consider Canadian buyer, but U handle shipping &
Customs!

Replies to: Ben Poehland (b.poehland@genie.geis.com)

I guess I always was really an XL Person, somehow I just never made friends
with the XE. With 4 600XLs, 6 800XLs, a 1200XL & a 1450XL, I still have
more than enough 8-bits around here :). I think the larger computers are
copulating while I'm not looking & keep making these little 600XLs. Now if
only I could figure out which ones are the females.... how do you tell?
There are no breasts or anything. The 1200 & 1450 are obviously Grandma
& Grandpa, they started the whole family. These XL computers are horny
critters, all they they think of is sex. That's what makes them interesting.
But the XE... well, kinda neuter. *sigh*

Hi everyone!!!

First of all, I would like to say thank you for the VERY positive response
there has been on the MARS 8 Project.

Secondly, I wanted to say that in the REAL WORLD, Projects and timetables
usually change due to well... CHANGE.

I would like everyone to read what Ben said about the instability of the
MIO. It's true, and I've been getting a lot of units sent in to be
repaired. Although I didn't design the MIO, I seem to have the responsibility
to fix and/or upgrade all the existing units. I have always been loyal to
the 8-Bit cause, and the MIO is no exception. Rather than telling a SYSOP
that his MIO will take 3-4 weeks to be repaired, and spending a lot of time
actually repairing existing units. I have decided to REDESIGN to MIO, and
offer new units, as well as giving existing owners the option of "trading up".

What this means, is that I will be doing this along with the MARS 8 Project
simultaneously, for the simple reason of a NEW 80 column board!!!!

This way, the MARS 8 will support the 80 Column Hardware on it's debut
release and I will be able to keep everybody with MIO's happy about keeping
them running into the year 2000. (This way everyone can watch the R-Time 8
change over into the next century without locking up!!)

Anyway, this will delay things for a month or two, and will give Darek
something else to emulate in the PC-Xformer. Which by the way
I am in FULL support of it, and have release the Disk-Based version
of MAC/65 as SHAREWARE to be used with it. (The only SHAREWARE fee that
is requested, is to buy PC-Xformer 3.0)

Needless to say, things are going to be triple busy and I won't have much
time to answer questions about the new products. My answer is simply going
to be to FINISH everything, then release them!!

If you haven't heard yet, SpartaDOS X and the Express! (by Keith Ledbetter)
Cartridges are available once again. FTe's numbers have been posted
in the Developers List, if you feel an urge to call. Both lines are going
directly to voice mail right now, and I urge everyone to leave your name
and number so that I can call you back at a time (convenient to both of us).

This way I can concentrate on the MARS 8, the MIO, and the new 80 Column Video board...

Thanks, Mike (FTe)

Source record: 99874

I found a program in the SIO2PC directory called AFS. This is supposed to be a program something like SIO2PC, but instead of emulating an Atari disc as an image file, it would read a directory on the DOS machine and the files would 'appear' as files on the Atari. The problem I have is that my Atari doesn't recognize the new disc. I have no problem using the SIO2PC with it's native software. I'm supposed to be able to use the SIO2PC cable for this program. It sure would be nice to be able to use this. Has anyone else tried out AFS and had any success?

Well, I'm distrubed too but not to any degree. This is just a hobbie for me.
If all the computers stopped tomorrow, I would lay on the ground, thrashing
in pain, then get up and take up modeling building or something. :)
Thats why I like the old Ataris. They where home computers. Hobby computers.
Not a box that has more speed than god and more heat to warm a small building.
But lets face it, the things are wearing out and are bulky.

the stage was set by the commadore 64 emulator. Strange but true. I really
doubt that if the Atari emulator was first, we'd see as much fuss

Here is my point of view. I have a house full of computer thingies. PC,Adam,
Ti994a, Commie, Atari..etc... My two most used computer is my 486 and my Atari.
My atari is getting less and less use. For one, there is really no place to

put it. Every day its getting more under powered for my needs. And its
failing. I have a closet full of Atari 8 bit computers and parts that
do not work. My 800 xl is like my third. A good emulator would be GREAT.
I could use the Atari 8 bit software that I want to use on a semi stable
hard ware (my 486). I get to save space.

Hey, Microsoft is a bad influence period! ;) But seriously, most people
out there are probably like me: I don't want to leave the programs written
for it, but most of the programs I use are on different machines. If it
isn't for emulation or a few half working pieces of hard ware, its might]
be time to move on. I would be surprise that by the end of 94, almost all
talk on this group with surround the emulator.

I feel that in the past year the "community" in all the classic systems
are dying off rapidly. Even rec.games.video.classic is seeing a slow
down in traffic. I know this is unrelated to some degree, but too me atlest,
the spring of 94 is the end (or the beginning of the end) of the classic
systems. The fat lady is now singing. She might go on singing for awhile,
but the curtents are coming closed.

Regarding using a spreadsheet for tracking a comic book collection...

A spreadsheet IS the wrong tool for this type of job, for the very reason you mentioned; the entire file has to fit in memory.

I do some consulting on the side and run into this problem fairly frequently - a spreadsheet user starts out doing some 'what if' analysis, and then trys to use the spreadsheet for many other purposes (I've even seen it used for word processing!).

The proper tool for any type of collection is a database. Most of the better Atari 8bit databases allow storage of records across multiple disks. (I particulary liked MegaFiler+, cus it ran FAST under SpartaDOS from my hard drive).

To obtain the summary information you run a report and have the software only report summary details. Packages like SynFile also support DIF files which allow some swapping of data between SynCalc or VisiCalc for more advanced analysis.

I think I agree with Jim. Turbofile has some pretty sophisticated report
generation features also, and though it has a few bugs, it runs extremely
well under SpartaDOS, especially SpartaDOS-X. Plan to get Basic-XL to
run with it though.... Turbofile is written in BASIC, with machine language
optimized USR calls.... but switching from Atari BASIC to BASIC XL DOES
help. No, Turbofile will not run with the BXL RUNTIME on disk or with
Turbobasic XL. Believe me, I tried!

That reminds me that it's pretty much a "go" for me to release Flickerterm. No backscroll buffer or Kermit, but very nice still. At least there is progresson this front, there is none on the spreadsheet front which is MY pet peeve.

I'm not sure why you are so hooked on Kermit. Doesn't your dialup have a "sz" variant by now? Even without flow control, with a Black Box at least my transfers go through quite reliably. I just drop in and out of Bobterm and Flickerterm for now.

As for the backscroll buffer, I use another utility known as screen. The size of the buffer is configurable up to who knows how huge a figure and you can back up and copy out the buffer to a file. Screen is like running X-windows in a vt100 environment because I can truly multitask various sessions. Much more convenient than suspending and running tasks in the background.

When I play muds, I run tintin as a client which gives me an IRC-like type ahead buffer. I run tintin under screen so I get my type ahead and backscroll buffer remotely :) Flick has a 1 line chat buffer, but I don't use it as much now since it disables vt100/ANSI bold characters and I enjoy the bold text when I play muds that support ANSI so Unix comes through and gives me all the goodies which the current Flick doesn't do or may never be able to do.

: seen it used for word processing!).

Updating the values of my comic collection using Diskbase would take FOREVER because only one record is on screen at one time. On a spreadsheet all the info is within cursor reach. The layout of the printout report would be all the fields for each record going sideways, not one after another like most databases print. It sure as hell sounds like a spreadsheet application to me.

There is a program called DBREPORT.BXE that will help you print out database records in a more customized fashion. I should probably look at it again and see if it will be sufficient. But no other database will work because none of them have the space and I have no intention of using multiple floppies when I can have a hard drive partition with Diskbase and an effective limit of 5000 records (sortable limit) or so. My comic collection isn't THAT big.

Diskbase has no internal method of tallying a total figure. This would have to be handled by a separate report program.

It would be so much easier to just have a large sheet to scroll through and just recalc it.

John Gibb - Computer Centre (jon@computer-science.paisley.ac.uk) wrote:
: I remember a long time ago seeing an article on how it was possible to
: drive a modem or any other serial device from the atari joystick ports.

There was a commercial modem for the joystick ports. They can only drive 300 baud reliably. But the traditional technique is to use only one port I think. If you used both, you might be able to change the way the bytes are sent and received and push it up to 9600 or more. I mean there WAS a hard drive interface for the 800 that ran through the joytick ports and that HAD to be able to do at least 19.2K, probably a lot more. 2 joysick ports = 1 parallel port (2 sets of 4 digital bit signals).

Adding an additional PIA can be a project to create an internal RS232 interface but the info on doing this is still vague and I've never heard of anyone doing this. Again, for the umteenth time, I direct those on a budget to wait for the R:P: because it will be as affordale as a P:R: or 850 (when they were newer) and will support CTS/RTS hardware flow control.

I've just uploaded two new Spartados utilities.

Filenote.arc and shellgx.sfx to the atari/8bit/Spartados/ directory
via bart.

filenote.arc adds notes to files and programs.
shellgx is a version of shell.com for version 3.2gx of spartados for FTE.
It adds a search path of sorts, checks for disk corruption, and
IOCBs that have been left open.

Both these programs were written by Tom Hunt.

If I understand you correctly, Diskbase can print the way you want,
with all fields for one record on one line. (I just tried it.)

Spreadsheet programs are designed primarily to calculate numbers.
Database programs are designed primarily to keep track of usually
large amounts of information. Database programs are usually much
better at working with text, and at calculations within a record.
Spreadsheet programs are usually better at calculations between
"records". Many times either will work, but usually one is at least a
little bit more suited to the task at hand.
Database programs are ALWAYS better when you need to keep track of
more information than will fit in memory at once.

At our last Atari user group meeting I tried to help someone who
wanted to set up a spreadsheet using a database program (on his ST).
You two should get together.

Has anyone done a relational (not flat-file) database program for the
Atari 8-bits?

From: lordthan@news.delphi.com
Message-ID: <2vvpim$32v@news.delphi.com>
Source record: 99896

A call to arms! :)

I need help from _everyone_ on this project. If this plan comes to fruition, it will mean a vast quantity of readily available programs for all Atari 8-bitters so please put forth some effort to help. I don't know if this has ever been tried before but we'll see what happens.

There's been a bit of talk on this newsgroup about commercial software being available via ftp -- or more accurately, the _desire_ for it. I'm willing to take the time and money to send a letter (which I've already written) to each software company that has produced software for the Atari 8-bit computer in hopes of getting permission to post the program to an ftp site and make it freely available. What I need from the Atari community is the addresses of all those companies. If this works, we'll be able to provide everyone with programs such as MULE, Star Raiders, Ultima, and others. I'd like to send out this barrage of letters by the end of July at the latest.

I'll periodically post a list of the companies I've gotten addresses for. Hopefully I'll get a lot of user support for this idea, but hey, you never know. I recently discovered first-hand that many 8-bit Apple programs are available for ftp (such as Ultima, Bilestoad, Castle Wolfenstein and others) so there's a good chance that they'll let Atari 8-bit files go, too.

Feel free to post or mail and replies to this message, but PLEASE send addresses of software companies TO MAIL ONLY as it's far easier for me to collect mail than it is to collect newsgroup messages. Thanks! :)

I made this insane game (which at first was going to be sort of like some of the "bomb the ground" style games from the early years of the Atari 2600, but which ended up being a totally twisted Buried Bucks (for Atari XL/XE) game).

Anyways (what a line up there.. "I made this insane game." :))

ANYWAYS!! That's it, I'm nuts.. ok, the game is in QBASIC and runs like crap on my PS/2 (but just enough to be fun).. I haven't added everything I want to (who knows what else that'll be though!) and I figured, it's such a simple little game that it'll be very do-able in Action! or even maybe TurboBASIC XL with some IRG font background and player/missles..

Why in the hell am I posting this? Well, maybe to warn you?? :)
(I spent at most 7 hrs making the QBASIC PC version so far, and will spend at the most another 3 or 5 tonight, and I'll probably have the 8bit version done by Thursday :))

so .. get ready for some weirdness!

ITAY! GIMME IRG/APAC CODE! >> NOW !! << :) (j/k.. I WISH I could do that.)

AC File Copy Set For Sale

Cleaning up around here I came upon the set of Office Copies I used for reference during the days I produced AC.

It's a complete set, all 9 issues from Dec. '92 thru April '94, including the extremely rare Feb. '93 issue which has been unavailable for over a year.

$45 including postage. I will NOT break up the set.

Back issue copies of the other 8 issues are still available thru July 30. Price is $5 each postpaid anywhere in the world.

Disks are no longer available.

Check, cash, or M.O. to:

BEN POEHLAND

I would be very interested in connecting an atari drive to the PC parallel port so any info would be appreciated.

Dave.

OK, I've uploaded the premier issue of the Compy-Shop-Magazine to the archive.
I guess it will be moved soon somewhere (into 8bit/Magdisks I guess) so
you'll be able to get it.

The filenames are: csm8802a.dcm and csm8802b.dcm

I've also got one other issue at home, but currently I don't have time
to upload it, sorry. I'll do it after my exams.

Hi,

So far, have NOT been able to get this particular combination
to work ... I have a 1meg MIO, with SpartaDos 3.2d (boots from
ramdisk). I've tried about everything I know, and all Ice-T
does is come up ... dead .. ie., it is locked up. The prgm.
works fine with MyDos, so the prgrm. file is not corrupt.

Any ideas???

Itay, will this program work with SpartaDos???

Bill

b.poehland@genie.geis.com wrote:
: Responding to Jerry Dunham's comments on my negative view of the XF2
: postings:
:
: Of course I must begin by pointing out that I'm entitled to an opinion just
: like anyone else. Unlike Bob Puff, I have no ambitions toward sainthood &
: have been known to get "down & dirty" in this forum from time to time. I've
: even been known to *want* to bug people from time to time. There's nothing
: more frustrating than trying to bug people & they don't get bugged. My main
: frustration in this case is that Jerry seems the only person in this group
: who cares enough to be disturbed by my comments.
:
: My comments were intended as a mild riposte toward the recent flood of XF2
: chatter here, which quite frankly I find boring/mildly annoying. However
: I must admit I am caught off-guard by the rapidity with which this thing has
: heated up & am generally in sympathy with Jerry's plea for the adoption of
: some degree of moderation in the emotional levels.
:
: Someone suggested the interest in the emulator topic was mostly on the part
: of old-timers (10+ years users). I'd like to disprove that theory by
: counterexample: I'm an 11-year user who also has a roomfull of PC-thingies,
: but I have no interest in 8-bit emulators whatever. I believe there are
: enough folks like me to render the assumption false. If I want to use my
: 8-bit, then by golly I'll use the real thing not an emulator. To me, the PC
: is something to use when the software I need doesn't exist for the 8-bit.
: I didn't intend we should shut out emulator discussions in this group
: completely, but I think the complaints have centered on the fact that recently
: they've been rather excessive. Fundamentally the complaints are directed
: toward restoring some sense of balance-- which was also the intention
: of my complaint.
:
: Michael Current's suggestion was a step in the right direction, but I think
: impractical. Human nature being what it is, people are just going to post
: wherever they please & not bother to categorize their response beforehand &
: post it to the proper group (assuming I understood that right). Adding an
: emulator section to the FAQ is an excellent idea. At least then us grumblers
: can say "Hey doofus, read the FAQ!" whenever someone posts an emulator
: question that's already been hashed over a hundred times.
:
: People need not worry that I'll really get pissed over this issue & leave the
: group. I was extrapolating the situation to the extreme to suggest what might
: happen in the worst case. Compared to the volume & viciousness of the "hate-
: mail" I received in the wake of the demise of AC, this little XF2 thing is
: a tempest in a teapot.

:
: My perspective on things is radically different from what I see happening in
: this group. I would trade all the emulators in the world for a few useful
: upgrades to BobTerm (a reliable VT-100 emulator, addition of KERMIT protocol,
: and multi-screen buffer for 8-bits with expanded memory), or just one decent
: schematic-drawing program. It grieves me to see a talent like Darek's being
: squandered on emulator programming when there are so many software needs un-
: filled for the original hardware. (A purely selfish attitude, I admit.) Of
: course poor Darek has always been a misguided fellow, I fear that Microsoft
: place he works at is a bad influence on him. (If that statement doesn't get
: me a flame, nothing will! :) Howdy-do, Darek!)
:
: My facetious comment on the word "community" was intentional. 2 or 3 years
: ago I felt a sense of community here. Now that element seems missing. Maybe
: the group has changed. If so, I think for the worse. Or maybe it's me that
: has changed, I don't know. But something is different now, that is certain.
: I don't think my postings carry all that much influence here any more, many of
: my postings lately seem to be ignored (except when I'm offering deals on
: desirable hardware). That Jerry Dunham was the only person who picked up on
: my sarcasm is illustrative. A few years ago a comment like that would have
: brought down a storm upon me. Today, it goes by unchallenged except by one
: person. Q.E.D.
:
: - Ben Poehland
:
: PS- Please post responses to the group, not to me.
:
:
You posted all this just to say that you are biased against PC's and Biased
towards the Atari 8-bit computer and you dont want nothing to do with a PC
because its the enemy and even if it runs an emulator you still hate PC's and
you see them creeping into your conference so you take offence, this is a
summary of what you just said above. So you hate Microsoft, who gives a rats
ass and you hate PC's big deal. I like to have both on one machine, takes up
less space that way.

: >> We are the Daleks! Exterminate! <<

There are hardly any posts about anything on any of the old classics because everyone else has moved on. Some of us want to use the emulator to relive the old days. I STRONGLY disagree, the EMULATOR IS THE ENTIRE FUTURE OF THE ATARI 8-BIT PERIOD! This is a PUBLIC DOMAIN version of the emulator and the one that will be sold will be a lot better and future upgrades will make it better than an Atari 8-bit. You can have the entire atari collection of games on a bunch of 1.44 floppies formatted to 1.92 megs! You can turn basic on and off with one keypress, you had to hold down option on the 8-bit computers, it runs way faster than the Atari 8-bit, takes up less space, takes less than a second to boot off of floppy, you can take it with you anywhere you go, use it on just about any computer anywhere, its virtually diskless, no trillion disks to look through to find Super Pac-Man and Kara
Karateka and it will get better as time goes on. I used to own an 8-bit and now I still do, through the emulator. I know all about this stuff!

Just thought I'd post in praise of Kevin ???'s (I've lost your address) Antic magazine archive at ftp.clark.net. A friend of mine has the son of an old friend -- a master Atari hand, recently and too young deceased, alas -- in town for some R&R. The kid was pretty quiet, until we started talkin' Atari! Turns out he lives in some tiny backwater town in North Carolina, where "nobody else even knows what an Atari -IS-!", and has been trying without success to reconstruct his late Dad's modem (Dad was a hardware hacker and had the modem all taken to pieces when he passed away), get a few Antic disks to work, etc. etc... Most recently, the kid was trying to figure out the Antic Music Processor (Dec. '88) without any kind of instructions, and among other things managed to wipe out the Antic '88 DISK he was using (Dad's drive had been modified to include an "override write-protect" switch, too). Well, the kid was overjoyed to find the Dec. '88 issue of Antic in my friend's magazine rack, so he copied down the program instructions -- and I told him I'd look for a refresher copy of the disk itself. I just found THAT on Kevin's archive, and will be downloading it all onto a fresh floppy to give to one soon-to-be-happy kid!

Thanks, Kevin, for helping complete a story worth of the pages of Reader's Digest.

Chris Chiesa

3835. Some info, please...

I recently pulled my old 800 out of the box it was stored in to play some of my old games (including the ones I wrote myself)... It's been several years since I have used the thing, and I've been reading this newsgroup to "catch up" on what's been happening in the Atari 8-bit world in these past few years (a lot apparently!)

I have a few questions I was hoping someone here could answer for me:

What is a "black box"? I've heard it mentioned here, and it seems to be some kind of add-on for the Atari. What does it do?

I have floppies formatted with both DOS 2 and DOS 3 (on a 1050 drive). Will MyDOS or Atari DOS 2.5 be able to read both formats?

What is TurboBASIC XL, and Action! Are these newer languages for the 800? Will they work on an original 800, or do they need one of the XL machines? Are they disk-based or cartridge?

Does the SIO2PC interface work reliably? Does anyone know where in the Bay Area I might find an SIO2PC cable? (I'm not good with a soldering iron, and would not feel confident enough to try building on myself).

Thanks for any help you can provide me!

Happy 8-bitting...

Ben,

> I don't have an immediate explanation, but I suspect a ROM bug. What version
> ROM do you have in your MIO?

I have v1.1 in my MIO and I am using v4.20 SDX. I even tried swapping
my old 4.19 ROM into the X cart. just to see if something was flaky there.
Also, if I did not already state it, Both the MIO and SDX seem to work
fine on there own. (Well... My system did always act *slightly* odd with
the MIO connected -- the computer seemed to lockup just a tad more often.)
Oh, I also tried running SDX in BANKED, OSRAM, and NONE configurations.

> I seriously doubt the problem is in your supply bus. If so, it would grow
> linearly *worse* with each additional cart you stacked on. Instead, you had
> at least one condition where the addition of the extra cart load seemed to
> to smooth things out. Plus you had anomalies just by switching the same
> carts around in different order, which makes no difference whatever to the
> supply (a load is a load). This is almost certainly a firmware problem.

I would tend to agree, but.... why did everything work fine UNTIL I added
a second POKEY. (I actually did a SV2.1 upgrade first -- only making sure
everything powered up ok before adding the POKEY). That's why I suspect
something happening on the bus. Doesn't the addition of the MIO add
additional TTL loads to the bus? I am not very skilled at electronics,
but is it at all possible that the the SDX cart could be putting to much
of a load on the bus and the addition of another cart could adding enough
pull-up to lessen the effect.

The SDX format menu always had a flickering character in the lower right
corner w/ the MIO connected (for reasons completely unknown to me) but now
things are just plain weird. The whole problem seems to start with that
format screen. Why are there conditions where only it is affected?
I really would like a look at the source code to see how it does its
banking. Perhaps there is a problem in a 74LSxxx somewhere? Or, as you
say, a firmware problem?

I am going to try to borrow a friends completely unmodified 800XL to test
things on, since I really don't want to have to undo the Gumby.

Hey, I'd like to make a screen mode SIMILAR to Itay's 64 color mode in
"The Wall" (now up at the archive I believe in the Games directory).. except..
it'll simply be a 16 or so color mode. It'll use IRG text mode with two fonts
and two sets of colors to be fed into the palette every other frame.

Ok, this I can probably code fine in Action! as a PROCedure, but I'd like it as
a VBI.

How do you do it in Action!?

thanx!

> What is a "black box"? I've heard it mentioned here, and it seems to be
> some kind of add-on for the Atari. What does it do?

The CSS catalog lists it's summary as a: "High-speed interface device for
hard disks, modems and printers. Features Ultra Speed disk drive transfer,
printer buffer".

That's not all, it's an up-to-19.2k-bps RS232 modem interface,
Parallel printer port with optional 64k buffer
SASI/SCSI hard disk port
Addition to your OS (config menu, monitor, coldstart, faster disk access)
MIO hard disk interface compatibility mode
Add-on's include:
"Enhancer" - enhanced printer functions and built-in sector copier/editor
"Floppy Board" - an IBM PC disk drive interface (up to 4 disk drives, any
density or disk size, up to 1.44MB 3.5"!)

The BlackBox requires an Atari with a PBI port. That includes 800XL and
65XE. There is an Atari 130XE version which uses the ECI and cartridge
ports.

If you want a speedy modem interface, get the R:P:Connection which is
coming out soon from CSS as well. This only requires an Atari (any model).

> I have floppies formatted with both DOS 2 and DOS 3 (on a 1050 drive).
> Will MyDOS or Atari DOS 2.5 be able to read both formats?

MyDOS and Atari DOS 2.5 will both read and write Atari DOS 2.0 SD disks.
(Why did you get DOS 2.0 with an Atari 1050 drive?). They will also both
handle Enhanced Density 1050 disks. MyDOS will handle any size up to 65535
sectors (8 or 16 megs, depending on density) per disk, so up to ~130MB.

> What is TurboBASIC XL, and Action! Are these newer languages for the 800?
> Will they work on an original 800, or do they need one of the XL machines?

> Are they disk-based or cartridge?

Yes, no, both! :) One at a time, please!

TurboBASIC XL: (c) 1985 Happy Computing by Frank Ostrowski (sp?)
This is faster than Atari BASIC, has more RAM, requires
an XL/XE, can't run under SpartaDOS (disk based) because
it uses the "under the OS" RAM just like SpartaDOS does.
It has a compiler and runtime package, more commands,
is more structured, and does procedures (no functions,
no parameter passing). There is an Atari 800 version
called "Frost BASIC" also available on the archives.
It is a "SHR"unk disk, so you'll need the SHRINK
archiver program. (Why was it not DCM'd?)
This is PD or something. (I never found out!)
Both are disk based (you figured that out by now huh?)
Action!: (c) 1982 Action Computing Services and OSS. This is a compiler/
editor combination. THE fastest language on the Atari other than
assembly. It's based on C, Pascal and BASIC. IMHO, it's a very
good step between BASIC and C (although I learned Pascal first,
but that was a horrible experience.. Apple IIe's.. yuk)
Supports different data types, simple record types (no arrays
in records or records of arrays), has functions built-in to
the compiler, but you can rewrite any of them. Function's
are unfortunately not recurive, but accept parameters.
Variables can be attached to memory locations. Pointers are
allowed (AHHHH! NOOOOO!), etc. etc. etc. This is on cartridge
and FTe is re-releasing it. I do not know if it is a new
version or not..??? It up to now has also been VERY hard to
get a hold of (I was lucky, thank you Bob Woolley! :) :) :))

> Does the SIO2PC interface work reliably? Does anyone know where in the
> Bay Area I might find an SIO2PC cable? (I'm not good with a soldering
> iron, and would not feel confident enough to try building on myself).

Yes, SIO2PC works like a charm (although version 3.15 goes nuts on my
PS/2 sometimes, I dunno who's fault that is though. v.3.18 is out now
but I could never get it to unarchive).

I think SIO2PC + either a modem on your PC or an R:P:Connection on your
8-bit is a good, less expensive replacement for a BlackBox. It is NOT
the SAME as a BlackBox. I still WANT a BlackBox! But.. so far this is
all I can afford (btw, this PC is NOT mine, so THERE :))

> Thanks for any help you can provide me!

TO whoever can help me--
I recently got an old 800, as is, with all kinds of goodies, but
no power supply. I need, therefore, an 800-compatible power supply (I
forget all the specs, but I know it must be an 8-pin DIN connection to
the 800). *Or* I need the name & phone # of that company in CA that has all
sorts of 8-bit equipment; someone out there gave me that number a few
weeks ago, I called and they never sent me a catalog... and of course, I
didn't keep the number or name. Arg. Please help!

Many thanks, o helpful folk!

3843. BOMBit 1/2 done:

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-14 00:30:18 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940713173023.23c01005@sonoma.edu>
Source record: 99820

The IBM version of my simple 1-day game, BOMBit is now available at

ftp.clark.net

The Atari XL/XE version will be there hopefully soon, as well.

Both versions will be available at the UMICH archives whenever I can login!

BOMBit is a simple arcade-style game reminscent of the early 1980's video
game "Buried Bucks."

The IBM version requires 320 x 200 x 256 graphics and QBASIC. It runs
slowly on my 8086/4mhz machine, but should run like the wind on any other
machine (there is a simple slowing feature).

The Atari version will have no requirements (I hope) as it will be written
in Action! and compiled with the runtime package. (The Atari version will
hopefully also have a bit of graphics code by Itay Chamiel which enhances
the mode used by adding more colors (NOT in a Display List Interrupt, however,
like done with many games, including his "The Wall")).

I hate to admit it, but the IBM version IS a little buggy, but playable.

The game includes 7 types of objects (dirt, money, plastic explosives, living
dead (skulls), metal blocks, sky, brick) and three enemies (skulls, bouncing
pig-head, and alien ship).

Again, the game was written in less than a day (and the thing's insane).
The ZIP is about 8k (hehe) and the sourcecode is (obviously) there for the
hacking.

The XL/XE version hasn't yet been written.

ENJOY!

Okay. I'm new to this Atari 8-bit thing... so bear with me.

I (actually a friend) has a bunch of 8-bit stuff lying around (computers, disk drives, a modem or two, nothing real fancy)...

I have an other friend who doesn't have a modem or computer or anything and keeps coming oveer yo use my computeer to net with.

So my question is is there a good 80 col. term emulator on the 8 bit? I know it'll be hard to read on a TV, but I'd like to try it since it's really annoying having him ant to use my computer for hours every time he comes over.

(Oh, make sure you give me a name - I looked in the archives and couldn't find any descriptions. Then I'll have to deal with getting it onto his Atari - since he doesn't have a term prog currently..)

I thought the 65XE didn't have a PBI or ECI, which was why Atari
didn't release anything for the ECI -- they had to support _both_
current machines.

I think I would have been very happy to get DOS 2.0 with my first
1050. I would have been happier to get 2.5 with it, though.

The only DOS that will read DOS 3 disks is DOS 3, but there are some
utilities (including one on the 2.5 master disk) that will convert
files from DOS 3 disks to DOS 2/2.5/MyDOS disks.

Are you implying that SIO2PC _can_ use the PC's modem for the Atari,
similar to the print-through feature?
I didn't think that was possible! (Somebody prove me wrong, please!)
Or do you mean download with the PC software, then convert to SIO2PC

disk images?

8-pin DIN???
The 800 used a barrel-type plug, with a 9 VAC, 31 VA supply.

The 800XL used a 7-pin DIN, with a 5 VDC supply.

OOPS!.. Yeah, I guess you're right. 65xe's don't have PBI's.. I always forget that. 600xl's do though, right? ALL I DO KNOW IS:

400/800/1200XL/130XE do NOT have PBI's
130XE ONLY has ECI :)

When I said SIO2PC + modem on IBM, yes, I did mean download stuff onto your IBM with an IBM terminal and then S2PC, MAKADISK or [I]nstall-via-SIO2PC the files over to disk images on SIO2PC for use on the Atari.

I WISH there was an SIO2PC's-MODEM !! That'd kick ass (and not cost my anything (probably) like buying an R:P: would.. but, I'm getting one whether I like it or not, cuz I won't always have this PS/2 (YAY! YAY! YAY!!!!!!!!))

Oh, and yeah.. I hate pointers :) I NEVER use them in Action! b/c I do my coding the oldfashioned way.. raw.. and as though it were BASIC ;)

I have been known to be wrong. You are of course correct, many
non-game programs used the extra memory to increase the user workspace
or to add some special features. I did not consider the possiblity
that anyone would want to run say atariwriter on an emulated atari.
From my point of view, it would be neat to see some of these programs
run on an atari, but I doubt if I would seriously use any of these
programs. My interest in the emulator was to perserve some of the
older atari games. Some of the later games do in fact take advantage
of the extra memory if it is present. I wasn't particularly thinking
of these games when I made my comment.

Mike

: addresses of all those companies. If this works, we'll be able to provide
: everyone with programs such as MULE, Star Raiders, Ultima, and others. I'd
: like to send out this barrage of letters by the end of July at the latest.

If they allow that they'd probably give up the source code too. If that
is true, I think contacting application program companies such as the
ones who produced:

Paperclip
Syn series
1st Xlent WP
TurboFile/word (shall we try again?)
AtariCorp i.e. Atariwriter, XL/XE OS etc.

Would be productive. I think some companies are beginning to smarten up
and realize that their programs will not earn them any more money and are
doing the right thing and giving up their rights.

For games, I'm sure some programmers would like to analyze the Lucasfilm
games, or Star Raiders SOURCE CODE (not disassemblies).

It sucks though because it is linked to the boot sector or something of
the disk. You don't physically LOAD that version of TurboBasic.
Therefore you are STUCK with DOS 2.5 and no better than maybe enhanced
density. Not to mention you probably can't compile on it.

I played with it and came to the conclusion it was worthless, but if all
you have is a couple 1050s maybe it would be functional.

TurboFile: NOT Impossible!

Yo, Glenn--

I still got an original copy of TurboFile I'd like to sell, $40 including postage.

It's yours if yah want it. Two disks & 130-page manual.

I agree with Jeff McWilliams' comments & other posts RE: the use of spreadsheets as databases, etc.

TurboFile is the Cadillac of Atari 8-bit databases. Perfect for a monster RAMdisk or hard drive. (Definition of "monster RAMdisk": 1-meg or more, not a Wee Wittle WAMbo.)

Try it, you'll like it! It was good enough to run AC for 2 years! This sucker will blow you away. BXL *does* help. I've got a spare BXL too if you're interested.

Actually, the 800, like the 400 should use the same
power supply that the 810, 1050 and XF551 disk drives use.
Or for that matter the 1020 plotter/printer and many other
Atari peripherals.

3858. Gauntlet: A totally cool game!!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-14 06:47:07 UTC
From: ud264@freenet.Victoria.BC.CA
Message-ID: <1994Jul14.064707.13331@freenet.victoria.bc.ca>
Source record: 99835

Hi! I just recently got back into using my 8bit and I have been busy playing my favourite 8bit game, Gauntlet, a shareware game written by Donald R. Lebeau. Surprisingly, I find this game to be more entertaining than most of the shoot-em-ups I have for my ST. I am wondering if anybody ever paid the $35 (US) shareware fee in order to get the registered version. The registered version supposedly had lots of extra levels and other goodies. Was it worth the large sum of money that the author wanted? I always thought that $35 was way too much to ask so he never got any bucks from me. I think if he had asked a reasonable price such as $15 he could have made tons of bucks. My other question is: does anybody know if Donald wrote any other games for the 8bit or any other machine? Judging by the quality of Gauntlet, I would think that today and he would be busy writing console games for some major software house.

Ted Skrecky

3859. THanks Clay!

Thanks to Clay Halliwell, I got an IBM version of ColorSquashView running! (It's very crude compared to the Atari version, but it's also just from a small grey viewer in 100% BASIC (well, he did bit manipulation via an ML call, but I did it via "AND" in QBASIC) and I'll be adding this either into RGB/GR9 Viewer or as a small external .RGB-only viewer.

Anyways, I'm sure only a few of you care since it's an IBM program and why waste time running a viewer on your IBM when you can run it on your Atari 8bit!? :) But still.. it was a challenge to program (well, the other stuff was, .RGB was just a conversion and testing :))

Later!

Yes, I'd be very interested in such a thing. I tried making sort
of a 'reverse SIO2PC' last summer to hook up Atari peripherals to
anything with an RS232 (like a PC running Linux, or even the
VAX's, or Alpha's at RIT) but I could never seem to get it to work.
I know I was sending valid status requests to the drive, but it
either never responded, or I wasn't getting the response. I figured
it was because the clock signal was also needed, and I wasn't
supplying it. So, let me ask you-- which signals to the SIO did
you actually use or need to get it to work correctly?

And definately post the source, and a pinout for the cable, if you can.
Thanks (and could you email it too, in case I miss it?)

3862. interupt cycles

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-14 14:46:27 UTC
From: belitz@informatik.rwth-aachen.de
Message-ID: <belitz.10.000EC69E@informatik.rwth-aachen.de>
Source record: 99842

I think, that someone was asking for the cycles you can manage in an interupt.
Here the information, as I've found. I quote the german "ATARI PROFIBUCH" by Sybex: "The Immediate VBI should not contain more than 4500 cycles."
"A Deferrend VBI could contain nearly 24000 cycles without any problems."

I hope, I can help you.

Question : "Are there any other books in amerika dealing with "hardware-near-progamming" (I hope, you will catch the sense, my english is not the best) than "DE-RE-ATARI"?

bye Matt

Hallo !

Is here anybody, who could give me some information about Spatados ?

Which are the main features of it ?
Does Spatados support Harddiskdrives ? I've heard something about, but I'm not sure !
Which drives are supported ?
How does Spartados manage this ? Does the Harddisk have it's own handler (like H1:) or how it is organized ?

Thank you .

Matt

Message-ID: <01HEP2N7BSWC8WZQTL@vax.edinboro.edu>
Source record: 99840

I am trying to accumulate various versions of tetris. I am looking for
a game called Fortress (I hope it's PD) -- I used to have it, but managed
to dammage my only copy. I am also looking for a version of Columns.
I know one exists, because I played it. I just cant seem to remember what
it was called. (I started to write my own, but then got to thinking that
one already existed).

Anyone know of these??

I think I have a couple that are not already in the archives. Anyone
want me to upload them???

-Adam Conover.
a644690c@edinboro.edu

Ps. Remember a game called SnowBall Fight (or something like that)?
Does anyone have a copy that actually works correctly. I've come
across two or three versions that play fine for a few min. but
then start to crash. It's a really fun game when it works!

3866. Upgrading an XEGS

Newsgroup: comp.sys.atari.8bit

I know this question has been asked over and over again - but where can I find documentation on upgrading a brand new XEGS?

Also - is the ROM the same as an XL/XE rom? Can I replace it with a US+ or MUX OS ROM directly - or is there further modification required (ie.. Atari 800)?

I havent yet opened up this XEGS and have no idea what it looks like inside..

3867. Redirecting S: and K:

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-14 17:29:08 UTC
From: pab@cnx.sccsi.com
Message-ID: <bc5_9407142354@cnx.com>
Source record: 99791

In a message about Redirecting S: and K:,
A644690C@VAX.EDINBORO.EDU Observed:
<-->

A>What I want to do is send all E:,S: and K: data to R2: and send all R2:
A>data
A>to either E: or K:

Do you have a copy of "Mapping The Atari?" I don't have mine handy, so
I can't give you the exact address or write code to do it. But I can
give you the easiest method.

Write a utility to locate the addresses (in HATABS) of R, E, and K.
Replace the GET BYTE and PUT BYTE addresses of E with those of R, and
the GET BYTE address of K with R's. There is no output to K:. This is
the same technique used in MTA to redirect E: to P:.

Another alternative would be an ML routine to Close IOCB #0, Re-Open it
to R2:, and set the baud, translation, etc. and start concurrent mode.
This is a technique I used in AtariLink's "doorway" routines, and will
work for most uses.

The problem is that with these two methods, you'll probably need to use
your own programs. With the first, you'd need to manually change the
'device number' field in the IOCB's used by K: and E: to 2.
Alternatively, you could use the term on R1: and your modem on R2:, but
it might still be touchy. And the second method would have to be done
every time you do a GRAPHICS command. And then we have to wonder if
your terminal would be fast enough (9600 at a minimum) to keep up with
the E: handler even under a standard OS.

For general knowledge, I have replied to Andy Floyd (who complained about my not submitting his article "Cross Stitching Your Atari" in Atari Classics) with:

>Andy,
>
>Ullp...I guess you've taken me to task. I beg forgiveness. Yes I did
>receive your submission. I did talk it over with Ben somewhat, with
>some suggestions made back and forth on how to improve it before
>publishing it. But, yes, I was working on two or three articles of my
>own, and pushed it down the priority queue one time too many.
>
>If you wish, I can pass it on to Rick Reaser for possible inclusion in
>Current Notes. Rick is always asking for submissions to his 8-bit
>portion of that magazine. Or I could pass it on to the new editors of
>AC (I haven't been contacted to continue on there). But in either case
>I don't believe they will offer an author's payment (their policies).
>
...

In my own defense, I did believe the article needed some work, and could not be "dropped in place" in the magazine. I did review and submit Tom Andrew's article/program on Spirograph-type programming, and answered several pieces of mail directed to me. Also, editors were not paid by the article, but rather by the year, so I was not pumping out my own articles for personal monetary gains.

Adam, the games you are thinking of are Fortress (obviously) and yes, it's PD- it's the one with a few musics in it and the spiffy DLI'd title screen with clouds and stuff going around a big castle.

The other game is Ultra Tetris, it had a big, animated 3d low-res title (cool) and I believe ran in BASIC (??)

I've also made (never finished, needs a LITTLE work) a rather slow Dr.Mario clone called "Dr.Atari" which I guess I'll release one day.

Let's see, what games ARE there?

Tetrix - PD/share ok
Atartris - PD/share very good
Atartris II - PD/share VERY good
Valgus^2 - PD/share(demo?) peices go from sides to center making squares very good
Dredis - demo/commercial peices fall down first then to left or right (in two player mode, one player goes left, the other right)
(Only Atari tetris clone with real russian music! :))
CoolTris - PD >I< like to think it's good ;) , with bombs and stuff
UltraTetris - PD/share like columns
Fortress - PD/share ok

Is that it? Are there any other columns clones? Does "cultivation" (another one of my favorite puzzle games) count as a 'tetris'? didn't think so ;)

Oh yeah, and Dr.Atari'll be on that list when I release it.

Later!

The PD gauntlet is Dandy.

But THIS PD game named Gauntlet is not Gauntlet. It is a sci-fi game.
It is great. It reminds me a little of Scorched Earth on the PCs because
you have similar weapons and there is a ground area you can chew through,
but it is more of a shootemup than a trajectory 1 on 1 battle.

It seems like all the animation is on the bitmap level, but it COULD be
single resolution PMGs. The enemy movements are very sneaky, and the
animation overall is top notch. Smooth as silk. Lots of variety.

You will be surprised. It only has 2 RAM chips. I picked up an upgrade text file somewhere but I probably lost it. The OS also has some other junk in it banked in I think like Missile Command. I ran my PRO! board briefly on the MUX with the XEGS but the XEGS puttered out on me and I don't know why. It may have been a bad hand-solder job and a loose connection on said joint or it could have been an incompatibility in the OS ciruitry or it could have been the machine just dying naturally.

I'm still of a mind that the XEGS OS _IS_ replaceable without any trouble but that is just my best guess.

I really like the XEGS for some reason, but it's too bad that upgrades usually don't apply to it.

Same with the 1200XL.

(Discussion of 'Gauntlet' by Don Lebeaue (sp?))
I sent Lebeaue $3. He cashed it. The version I have did not ask for
$35, I don't think. I just liked the idea of shareware this, the first
time I ever saw it. I never play it, it has never been played by anyone
in my family. But I do keep a copy in my collection.
One other thing. 'Fortress' is pd, but one very important thing, I
haven't registered it either, but never play it. that's not the
important thing. The important thing is it is CLEARLY shareware and if
you use it and enjoy it, the whole need for shareware in Atari 8-bit is
to REGISTER it. Jeff Potter and others (I never look at GIFS, don't
even have Jview or colrveiw, I'm sure they are great.) REGISTER it and
let people know that it is shareware, not just pd.

Nope, totally different. The commercial Gauntlet from Mindscape
was a port of the Atari coin-op... Which was based on the APX
game Dandy by John Palevich who later did Dark Chambers, a
better Gauntlet than Mindscape's.

The other "Gauntlet" is a horizontal scrolling shooter.

Jeff_M_Lodoen@cup.portal.com

3879. Intel Demo!

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-15 01:44:58 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940714184508.23c01d7d@sonoma.edu>
Source record: 99853

I got a hold of the Intel Outside demo by Out5oft and, well, let's see :)

1) side A crashes.. any way to skip parts like with the Hard's Cool Emotion demo?

2) side B's file was corrupt. I got the disk in single files (PLAY.COM and the ".MD8" mod files) and I can boot and load, but the thing:
a) recognizes only physical drives, not MyDOS RAMdisk drives
b) understands that my SIO2PC is a drive, which might the be problem (goes too fast?)
c) reads directories, but doesn't let me choose a file like it should

When loaded, PLAY.COM presents you with two choices, [ESC]=reset prg. (doesn't really do much actually) and [SPACE]=directory. When I hit [SPACE], the choices breifly change to <- -> = select, [RETURN] = load, but, even though the disk has 5 or 6 .MD8 files on it, doesn't do anything except go back to the previous choices.

Has anyone here had success with the Intel Outside demo on NTSC machines? (or at all?) Could someone upload a NON corrupt .DCM copy of side B? Even though I only have a 1050 and the corrupt DCM seemed to want double density (and the total size of PLAY.COM + *.MD8 is like 175k), I can PROBABLY still make a DDensity disk with SIO2PC (unless that's its problem)

thanx for any help / suggestions.. I'm interested in this player! It claims 8.5khz (where MODplay only gives out like 5.something khz)

:) Gauntlet isn't a scroller ;) ... I does NOT seem to use ANY player/missles also, btw, because if it did, I'm sure it'd have more colors in it. I mean, he COULDA got away with a PMG for the player, and maybe a DLI between the game area and the status area ;)

It is one of my favorite games, too. There's also games like Buried Bucks, Planetary Defense, and, for the IBM, Chopper Commando 2.0 (and some games which're more like "what degrees to aim, how fast to shoot") which, like Gauntlet, let you wreak havoc on the background/terrain! :) I love those.

In The summer 13.07.94 Wrote Perry Reed following stuff...

PR> What is a "black box"? I've heard it mentioned here, and it seems to
PR> be some kind of add-on for the Atari. What does it do?

The Black Box is an interface connected in your expander port and you can
connect an modem in it and come up to 19.200 baud whith it. I dont really know
more what it can do more. But I think you can get more info in the FAQ.

PR> What is TurboBASIC XL, and Action! Are these newer languages for the
PR> 800? Will they work on an original 800, or do they need one of the XL
PR> machines? Are they disk-based or cartridge?

Turbo Basic is 3 times faster then the original Basic. I dont know if it works
on an 800.??

PR> Does the SIO2PC interface work reliably? Does anyone know where in
PR> the Bay Area I might find an SIO2PC cable? (I'm not good with a
PR> soldering iron, and would not feel confident enough to try building on
PR> myself).

Yes. Its reliable. I will use it whith my BBS.!!

```

Completely different game. The objective of Donald R. Lebeau's Gauntlet is to attack and destroy the enemy positions on a small moon. There are a total of 50 screens. The first 30 are above ground and the last 20 are in caves. On the last screen there is a king ship which you must destroy. There are a total of 17 types of enemy ships, some armed with more than one type of weapon. At one point an enemy could be firing a steady stream of laser fire and then it would launch a couple of robot ships that will try to smash into your ship. Lots of fun! The game is at its best if you select "elite" level. The number of ships and different types of weapons being fired at you all at once are incredible. And the game doesn't slow down!!! Another neat feature is that you can use your weapons to blast-away chunks of the lunar surface. If an enemy ship is on the opposite side of a mountain, you can blast thru the mountain and completely scare the hell out of the enemy. I notice that on the atari archive at Umich there is a game called gauntlet.com in the 8bit/Games directory. I suspect that this must be Lebeau's game. If so, everybody who is even remotely interested in playing games on the 8bit should immediately attempt to aquire a copy.

:

I put the MUX OS in the XEGS. The XEGS can't be the master (knock knock). NO PBI...;)

I started getting "fading characters" where little particles started showing up on the monitor. I _think_ it may have been the power supply because when I ran my air-conditioner I started seeing something SIMILAR but not nearly as bad on my 130XE. I really have no clue and at this point it is going to sit and collect dust. Once MARS8 comes out I plan on getting an 800XL for that and eventually getting my stock 1200XL upgraded to about 1 meg (I don't know if Newell will do it anymore or if I can send it to FTE or what) for the BBS. Obviously MARS8 is not necessary for a BBS unless you merely want a plug and forget memory upgrade. The rest of the capabilities would go unused at least in a PRO! board. I'm counting on CSS to release the R:P:. That's the only way I (or you when you were running a board) could run a 14.4 off a slave at full 19.2K throughput (at least without investing in a redudant BB as merely a modem interface).

The thing with 800XLs is I hate the keyboards. I have that text file I uploaded for putting a 1200XL keyboard on an 800 but I think the 800 pinout is a lot different from the XL/XEs. Transkey is an expensive bit of overkill when I've got an extra 1200XL keyboard lying around.

I'm looking for a replacement Adaptec 4000a controller card.. Seems mine
just bought the big bit-bucket!

I need to TRADE for one, though - since I'm considerably tight on cash.

I have the following items we can trade for (or make trades around):

155meg FH SCSI hard drive
Stock 800xl's
Brand new-in-the-box XEGS
2 x 1200baud external modems (1 Hayes, 1 AT&T)
INTERNAL (PC Type) 2400baud modem/9600baud fax
4 x 16bit (PC cards) MFM hard drive controllers
CX85 keypad

>much of the CPU's cycles get swallowed up by the other chips during display
>refresh, DMA, vertical blank, ect.. Post or email, doesn't matter. Thanks
>in advance!

Post or EMail back if this isn't sufficient. I may need to know more about what you're doing.

Memory refresh takes 9 cycles per scan line, with one exception. On the top scan line of a character based mode, which has almost no CPU time available, there is only 1 cycle of memory refresh. Some of these cycles occur during horizontal blank, (can't remember how many - 3, I think) and the balance occur in the left part of the display, one every four cycles. All cycles are completed by about 1/3 of the way across the screen. Memory refresh continues through verctical blank.

The basic rule of DMA, is that one cycle is stolen for each byte of data. Data that repeats on successive lines does not need to be refetched. With that in mind, here are some specifics.

Display list DMA requires 1 cycle for each display list byte. Usually that's 1 cycle, but the LMS instruction and $41 wait at the end will be 3 bytes - 3 cycles.

Display data DMA requires 1 cycle per byte. Just count the number of bytes your display mode uses. If it is a character mode, then you have the extra overhead on the top scanline of grabbing both the character value and the character set data, or 2 cycles per character.

Players, if enabled, require 4 cycles per scanline, (or every other scanline if in low resolution), and missles require 1 cycle.

This DMA occurs only on displayable lines, which you can count from the display list you are using. The total NTSC screen time is 262 lines, of 114 cycles per line.

I don't have figures on vertical blank, which will also vary a bit. You may want to create your own VBlank routine, doing only the stuff that's necessary, and taking up a fixed amount of CPU time that you know what it is.

Here's a timing example taken from the hardware manual, for the standard 40x24 text mode. Cycles are per 1/60 second video frame.

Display list - 32 cycles (Basically, just count the bytes in the dlist)
Characters - 40*24 = 960

Char Data - 960*8 = 7680
Refresh - 24*1 + 238*9 = 2166
Total = 10838

Refresh is calculated as 24 lines have only 1 cycle of refresh DMA, and the remainder of the lines, 262-24 = 238, have all 9 cycles.

Then, the total number of cycles per frame, is 262*114 = 29868. So 36% of available CPU time will be lost on the basic text screen. You'll need to add vblank on top of that.

Good luck,
John Harris - jharris@cup.portal.com

3887. XF551

3892. ATR 8000, ATR 8500, etc. for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-15 11:26:44 UTC
From: ccastn1@phantom.oit.gatech.edu
Message-ID: <305rpk$h7g@phantom.oit.gatech.edu>
Source record: 99765
Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers.other

I have for sale the following items. I am selling on a bidding basis, so no prices are listed. The higest _acceptable_ bid received by July 31 takes that item. Prices do not include shipping.

Reply by e-mail to ccastn1@oit.gatech.edu

ATR 8000 (64K) ----------
Can act as peripheral interface for _any_ 8-bit machine, providing a parallel port, a serial port, and a floppy interface which can control four standard drives (8", 5.25", 3.5", any density), in addition to daisy-chained Atari drives. Compatible with MyDOS and SpartaDos. Can also act as independant Z-80 CP/M computer, with the Atari as a terminal. Comes with CP/M 2.2 and all manuals.

ATR 8500 (64K) ----------
New and improved version of 8000, with a true UART for the serial port. Never released in mass production. Performs same functions as 8000, but requires a small interface board, which I do not have, to connect to an 8-bit and operate in peripheral interface mode. (Posting a request on the net should reveal someone who has the schematics for this board.) Comes with CP/M 2.2, ROM source code, and manuals.

Co-Power 88 daughter board (256K) ----------
Adds an Intel 8088 to the ATR, allowing the use of PC-DOS (in terminal mode, of course). Comes with PC-DOS and software manual (no hardware manual, but installation is simple).

Z-Time I daughter board ----------
A real-time clock for Z-80 systems. I have no manual, but it plugs in between the Z-80 and the motherboard, so it will probably work with most Z-80 systems in addition to an ATR.

Dual 5.25" high-density floppy drives ----------
Two 5.25" high-density (1.2MB) floppy drives, mounted in a case with a power supply and I/O cable. Drives format to 1.2MB under SpartaDos, but only 720K under MyDOS. Either or both drives can be replaced with a standard 3.5" high-density (1.44MB) drive with no modifications.

3893. Re: 80 Col terms.

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-15 12:42:26 UTC
From: winston@merk.com
Message-ID: <CszFAs.MK1@merk.com>
Source record: 99768

A good 80 column terminal program is KERMIT65 (K65).

You need to turn off color on your TV or use a black-and-white
solid state set like a "Quasar" and adjust the contrast so that the
pixel dots stand out like milk droplets on a dark table top. (It
takes some fiddling, otherwise your text is a bit "fuzzy".)

Kermit-65 shows black text on a white background.
Kermit-65 emulates a VT100 at 1200 BPS. I'm using it to type this
message.

3894. PAL and NTSC on Atari 8 bits

Shareware Gauntlet on the Atari is a arcade shoot-em-up that's
sort of a cross between Choplifter and Space Invaders, except it's not a
side-scroller. You have to eliminate different kinds of alien ships
and then exit the screen on the right. GREAT GAME! It predates the
commercial Gauntlet release bigtime. Better by far, as the game
action and sound in the commercial release bites.

> Thanks...

Theres no specialised PAL Atari 8-bit. The PAL machines just
display an NTSC rez. screen with extra black lines tacked on
the top and bottom in order to fill out a PAL screen. The
actual working screen is displayed a bit like a 'letterbox'
film. Unfortunately, the blank lines are generated by the
hardware and NOT by extra blanks in the display list, so
you cant just make a customised PAL display list - the screen
just rolls once you hit a certain point since the extra blanks
make the display unstable. (too many scanlines)

My name is Gale Putt and I started out my adult life as a Fortran II programer on IBM 7094 and little 1620's. I left the industry to raise a family and one day my husband brought me home an Atari 400, one of the first ones out, along with the 410 cassete recorder/drive.

We had one game, Kingdom which made the 400 seem like on of the most advanced computers I had ever seen! I keyed in almost all the games we had then along with a 40 word processor that was printed in Analoge (I think). This worked my little 40 column thermal printer.

My vote for the BEST A

tari game is CAVERNS of MARS.
I actually sold our brand new table saw to get the 400 bumped up to 16k and buy my first disk drive (a noise clunky 810 that wasn't that reliable till we had a data separator installed).
Does anyone remember a game called Guardian that had an angel that flew over you?
my other favorites are 2. Shamus 3. Caverns of MarsII 4. Drelbs 5. Pharoahs Curse.6. Choplifter

Would you believe the Atari's can do all of this!?:

320 x 192 x 8 colors
160 x 192 x 64 colors
80 x 192 x 4096 colors
80 x 192 x 256 colors
4 channel digitized sound (5kHz or 8.25kHz) for playing MOD sound files
Loading .GIFs
Talking to modems at 19.2k bps in 80 column mode
Making fractals
Making 3D Computer Aided Designed raytraced and/or shaded images
Connecting up to 130MB of hard drive space at a time
Networking together via a Local Area Network ("Multiplexer")
Using an IBM as a set of disk drives! (hehe, put IBM's in thier place!)
Using up to 4MB of RAM
Reading IBM floppies (up to 1.44mb 3.5" disks)
Hooking up IBM keyboards
Being installed in IBM cases
Rendering over 1500 pixels per FRAME in an animation
Doing Zmodem download
unZIPping
Reading QWK mail packets

Hmm.. what else is there. There's the old stuff like recording sound and
video, but that's still too old for the newer graphics supported by the Ataris.

And ALL of this can be done on most models (XL/XE mainly) of the Atari 8bits
WITHOUT MUCH EXTRA HARDWARE! :)

Cool, huh? How long have you been out of the 8-bit community? (Or were you
like me, never really IN it until you found comp.sys.atari.8bit)

I looked over the VBI-based locations on Mapping the Atari and over some of the discussion on it in De Re Atari and I'm going to look in Antic: An Anthology volume 1 for any VBI descriptions, but I'm still sorta stuck! I'm sure with some canned code in BASIC or assembled for page 6 I could do it, but I'd like to see if I can't make PROCedures in Action! run as VBI's! Is this possible!? If so.. HOW!!!??? :)

I may just end up relearning Quick again just for this project! :)

Winston Smith asks about Micro-Painter pics.

Wait :) I always get confused :) Which is Micro-Painter and which is Micro-Illustrated. I know one is compressed, the other is not. I also know that CVSquash's routine is based on one of the compressisonms (either one of those Micro- ones or on Koala's (if it's even different)).

RGB/GR9 View for the IBM can handle Graphics 9 (grey only), Graphics 15 (grey only also so far), CV9 (4096 colors dithered by 48 in 320 x 200 mode), CV15 (64 colors, real, in 320 x 200 mode), and I have code now which does ColorSquash unsquashing (the point of my original post).

I have yet to add: Atari OS colors (still have to look over the program Jeff Potter sent me), for Graphics 9 and 15 mode
Graphics 8 and CV8 support
Built-in CVunsquashing (so far I just have a seperate QBASIC program which I was playing with)
Koala and (other-compressed) file support (Graphics 15 I guess)
Graphics 10 and 11 (maybe useless ???)

Heheh... perhaps one day GED support!? ATASCII text support? Hmmm...

You are invited to come Join us at ACE of America. You do not need to be a Member to Come. Upcoming Meetings will consist of a Raffle and a Swap Meet. Our raffle will consist of Prizes Donated at the Last Swap Meet and other Donations including IBM Compatible Keyboards, Hard Drive Mechanisms, Disk Drive Mechs, Software for the IBM, Software for the Atari ST, Atari Classic 8 Bit HardWare and various gift certificates. Their is still time to donate Item's for the raffle. If you have something to donate for the raffle, call (503)256-9974 or Come to the Raffle and Donate their. If you have a business and can donate, please do so. Even Gift Certificates are welcome. And if your an ACE Member, your first Dollar's worth of tickets are FREE!! This Raffle will be August 1st. Meeting starts at 7 PM.

The Following Months meeting will be a Swap Meet. All club Business will be suspended. Tables are 10$, But if your a Member, IT'S FREE! Also FREE ADMISSION. And we expect a good Turnout because we advertise our Swap Meets. This Swap Meet, Due to the Holiday, will be Held Tuesday, September 6th, starting at 7PM.

Meetings are Held at the NW Service Center in the Basement at 1819 NW Everett. In Portland, Oregon. Plenty of free Parking!!! For more info: Call Ben at (503)256-9974, anytime.

3908. 1020 pen colors: is there a yellow?

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-16 02:14:51 UTC
From: krishna@max.tiac.net
Message-ID: <307fqr$b4p@sundog.tiac.net>
Source record: 99783

I just got 2 1020's. One works, the other doesn't. (or at least so I've been told). Now the standard here is for 4 colors:

black
blue
red
green

However, these colors are not sufficient to produce any color. Yellow is impossible for instance. In order to do all colors, the minimum would be:

yellow
blue
red
black

A TV has 3 artifacts. Blue, red, and green. But a TV uses additive color, and pens use subtractive color. In other words, a TV gives off light, and pen on paper reflects frequencies. So a TV can create white with RGB lit up and with a printer that would produce black or dark brown.

Is there a yellow pen available for the 1020? If there were it would then be theoretically possible to dump ColrView images to the 1020. It would probably take about an hour to print but it would be a lot cheaper than a Star NX-1000 rainbow.

With red, green, blue, and black, (and white for the paper) you could get away with it. Using various dither densities and overlapping colors and adding black with darker shades when necessary.

There is an ANTIC program which dumps standard pics to the 1020. This program could be modified for this project. Ideally you'd have to dump separate .R .G .Bs. However, the info might have to be converted from additive to subtractive before dumping. Just dumping red green and blue would create a mess.

3914. Alternate Reality - The Dungeon

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-16 03:05:54 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01HER3DA2JHU8WZT63@vax.edinboro.edu>
Source record: 99789

American Technivision has a sale going on now and 8bit stuff is really cheap.
Anyway.... I ordered AR the Dungeon and there seems to be a problem with
my third disk. When asked to insert it, I do. The disk reads for a few
seconds then the game askes me to insert the same disk (Disk 3 - side 2)
and there is no getting out of it. It does not believe any of the disks
are correct.

I called ATV and they said that I could just send the disk back, but if
someone would be willing to .DCM that disk and e-mail it to me, It would
save me having to mail the Disk. Also.... there are no bad sectors on the
disk, so I'm not even sure that the third disk is the problem.

Any help????

Thanks....

-Adam Conover.

[Article crossposted from comp.sys.ti]
[Author was cohen@GOMEZ.phys.virginia.edu]
[Posted on Fri, 15 Jul 1994 13:27:54 GMT]

I have for sale 2 monochrome monitors that I must unload prior to
moving. These are 10" or 11" high-quality monitors in metal frame,
industrial quality (like you see in H&R catalog). One is white
and blacxDk, the other amber and black. (The latter also has an
inverse video switch on the back).
These monitors are excellent at both 80 and 40 columns for text-
intensive applications (word processing, data base, spreadsheets,
BBS`ing etc.). There is video but no audio. They can also
be used with security cameras, VCR`s, other computers, etc.
They are very low-power units (save on electricity!).

Asking $20 each only! A monitor cable is available if{_ needed.

Please e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU as soon as possible.
Thanks.

From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <pyyQyg8.lmcclure@delphi.com>
Source record: 99793

In a messag dated 7-9-94, Bob Lange said:

"On 09/30/83 I bought an brand spanking-new Atari 1200XL
(boxed, in the foam!) and a Rana 1000 (SSSD!) disk drive
at the same time. $349.00 for the computer and $399.00 for
the drive."

I feel very fortunate. That same year, I purchased a 1200XL brand new from a local department store (Thalhiemer's) for a mere $150.00. Of course, the catch was that I took a chance on ending up with a 600XL instead. Atari had been unable to fill their order for 600XL's and had been substituting the 1200XL instead. At the time I "bought" my machine, what I would recieve depending on whether the 600XL's were going out the door at Atari yet when Thalhiemer's next order shipped.

That 1200XL, later upgraded with a Rambo XL to 256K is still with me today.

My next purchase was not a drive, but a 1027, and then an Atariwriter cart. For quite a while, I used my 1200XL as a dedicated word processor (or more of a super electronic typewriter, as I could not save anything). Within a few months came the 1010 datasette (which cost me almost as much as the 1200XL did).

Around Christmas of '84, I purchased a 1030 modem, which while not putting me online for the first time (having had a 1650 modem on my C64 since January of that year), allowed me to skip the slow boot of my 1541 drive when powering up to get online and read messages.

My first disk drives did not come until much later. My memory is a bit fuzzy on when exactly they were acquired, but I suspect sometime in '85 or '86. I got a hot tip that K-Mart was closing out their Atari stuff, and picked up two 1050's at $79.00 each.

YAY! VBI'S! Now I need my montior fixed :)

3921. Rent or borrow a big 8bit?

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-16 07:47:28 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940716004735.24000967@sonoma.edu>
Source record: 99797

Is this a stupid request? I'd very much like to rent either of the following:

Atari XL with 4mb RAM (for RAMdisk space)
Atari XL with Black Box and a hard drive (10 MB is probably enough)

Again, I'm not looking to BUY (unless it's especially cheap :)), just to
borrow for some program projects (ones which will take much drive access
and graphics work and will end up being software which is better run on
systems with a lot of RAM or a hard drive, rather than my 256k/SIO2PC/1050
setup.. I don't want to grow old and die trying to create most of the files.)

My next purchase will be a R:P:Connection (along with some extra $$ for
shareware fees to Bob Puff and perhaps to some other authors of software I use
and/or like a ton (Jeff Potter rings a bell :))) but AFTER I have purchased
an inexpensive 14.4k bps modem for it and my (friend's) PS/2 to share.

Anyways, I hope none of you think I'm insane yet. You will though, after my
next post. (And NO, the software mentioned in my next post is NOT what I want
this hefty hardware for! I'm not THAT mad!)

-bill
kendrick@vax.sonoma.edu |||

Hell, I'd rent a system..?

3922. Beavis and Butt-Head Atari 8-bit games

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-16 07:59:04 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940716005911.24000967@sonoma.edu>
Source record: 99798

Oh no... wait! Don't skip this message yet! This is funny! :)

Ok, tonight I had the stupid thought "There're no (good) Super Mario Bros.
games out for the Atari 8bit.. what about a Beavis and Butt-Head one?".
The thought passed..

UNTIL.. I saw one of the new episodes. I was laughing so much I was nearly
crying. I went to call my friend to see if he was watching it, totally
forgetting the fact that he's in Las Vegas for the weekend! :)

ANyways, the episode consisted of:

Beavis and Butt-Head going to Stewarts to give him his homework because
he's sick (I won't go into that <eww>)
Stewart's mom offers them "breakfast burritos" which they gladly take..
until they taste the egg in them ("she tricked us!" :))
They look for other food to eat. Beavis finds the snack foods, while
Butt-Head ends up finding olives and crap like that. Beavis starts
going insane and shoving it all in his mouth ("yeah! hehe! yeah! ehhe
cool! <chomp> hmmhehemhmm")
They go to school and Beavis is sitting twitching and talking to himself
at a hundred miles per hour because of all the sugar he ate. Their
teacher mentions "Nicaragua" and Beavis starts acting as though he is
some South American dictator named "Cornholio" (the title of the episode,
btw, for us B&BH fans :) (or is that fanATICs?) He sticks his shirt over
the top of his head and starts hitting on some girl, and, well, that's
all of the story you need to know. (Other than that he wants toilet
paper <!?!?>)

My (most insane) idea is to mutate Super Mario Bros. in this fashion:

Super Mario Bros. Super Cornholio Bros.
Mario ==> Cornholio
Luigi ==> Butt-Head
Coins ==> Toilet Paper
Mushrooms ==> Candy snacks
Fire-Flowers ==> Root Beers
Fire balls ==> Burps (excuse me)
SUPER Mario or ==> Beavis or Butt-Head with
Luigi their shirt over their head
(which by the way is one of
the funniest variations on
the characters, other than Beavis
wearing REALLY THICK glasses :))

Ok.. I've proven it. I AM nuts.. But still, any Atari 8-bit fans out here who actually LIKE Beavis and Butt-Head. I'm sure half of you (folks who don't get American MTV) have NO idea WHAT I'm blathering about, but perhaps I could make a small stupid Beavis and Butt-Head demo reminiscent of the Pee Wee Herman "Connect the dots" song demo for the Atari.. !?!?!?!?!?!?!?

Message-ID: <940716010224.24000967@sonoma.edu>
Source record: 99799

Ok, again, my Parrot sampler disk is DEAD (protection doesn't work right so it thinks my original disk is an unprotected copy <cry>).

I got a hold of the QXL sampler but I find it very unversatile. It doesn't let me change SAMPLING rate (it DOES let me change playback rate). When I record only a few seconds of a sample, it still plays back ALL 1:10 min of it, and still saves ALL 256k of it. The format is also (obviously) not standard Parrot format, and what I need is some small simple sampler much like the real Parrot one.

WHERE can I get a hold of it.

Just to clarify, I DO have a working sampler UNIT (the paddle-looking thing) but NOT sufficient enough software. (Although QXL is pretty cool for letting me record so much and banking the RAM nice and quickly.. I really needed that for my Minarets in Memory demo (did I release that? .. it sorta sucked.. it used 11k chunks from RAMdisk on a 256k machine :))

-bill

I thought the name of that game was Trust. It was a two player game where one person was an angel getting rid of temptations like a pipe (smoking), dollar sign (money), bottle (drinking)... There may have been more but that's all I can remember. The other player was collecting gems and avoiding the 'temptations' that the angel did not get.

P.S. Is 'Pooskie' a nickname?

A few questions - some of which aren't strictly related to the 8 bit.
But I'm sure you'll forgive me just this once.

1) What is the link (if any) between Atari Corp and Atari Games?

2) What is the maximum size of a cartidge prog on the 8 bit?

3) Is it true that Star Raiders is going to be released for the Jag?

4) How do I download Atari 8 bit files from FTP archives. I can't
connect my 800XL to the NET; I only have access via a PC - is there
any way of moving the files from PC/ST to 800XL?

Thanks for your help!

Bill, just a word of w warning about crashes using a VBI in Action!
Unless you stick them somewhere safe, like page 1 or 6 you always have to
diable them before returning from your program. Come to think of it, it's the
same way for just about any other language also including assembler. In
Actions case, the code starts right at the end of the text buffer so let's
say you've got your vbi right at the head of your program. Go back to the
editor & add a couple of lines of code & smash! You're vbi jumps to the
text you've just added. If the vbi is higher then then the text you just added
& survives the text editor, the first compile you do will rearange your
obj, but the vbi is still jumping to the original location. If your vbi
uses any of the built in commands in the cart & you return to the text
editor, crash againg with the vbi jumps to a cart address & maybe finds
destructive backspace where it thought it was setting a color register <g>.

On a follow-up, there was a sector editor available which showed the player-missle graphics on the left hand side of the screen as you paged through the hex data representation of the file. Anyway, I used it to change the pac-man character at one time. Does anyone know the editor I'm talking about? I can dig it up if not...

One game that I was hooked on that I have only seen on the 8-bit Atari and the Apple II was a game by RapidFire called FORTRESS. It was a board game where you built castles in stages. The object was to control the most number of squares on the board.

The game had "intelligence" built in and would gradually learn to play your style and get better as it went along.

The game was written by Jim Templeton and Patty Denbrook. It was distributed by SSI of Mountain View, CA.

Does anyone else remember this one?

3931. MIO PROBLEM

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-16 22:08:50 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407162208.AA279846508@relay2.geis.com>
Source record: 99658

Hello Adam,

The additional details on your flaky MIO now have me truly bewildered. Adding the 2nd POKEY for a GUMBY upgrade involves soldering many pins of the two POKEYs together... I'm tempted to say that if the 2nd POKEY was defective or was damaged in soldering, that could be the source of your troubles. Somehow, tho, it just doesn't quite seem plausible.

Since both the MIO & the computer work OK independently, it's unlikely you have a defective LSxx gate somewhere.

There's no way you'll ever create a "pull-up" effect by adding an additional cart (load) to the machine. Each additional load added to the +5V bus will only tend to pull the +5V DOWN, never up. (Not unless we're in a strange universe where the laws of physics have been changed!). Also, I rather doubt addition of the MIO adds THAT much to the TTL loads on the PBI ("fan-out" or whatever). ICD never released schemaics for the MIO so it's hard to say for sure, but if there were a situation where excessive TTL loads in the MIO would exceed the fan-out of the PBI, then those lines would most certainly be buffered (assuming the MIO was designed correctly, hmmmm...).

The flickering character in the format screen has me totally bamboozled. Yah know, ALL those ICD-style carts are super-sensitive to dirt/corrosion on the edgecard foil "fingers". Several times I had funky ICD carts that responded well to the old pink eraser treatment. If you've already done that, then it's time to give Mike Hohman a call. All the symptoms you're describing are indicative of either an intermittent contact problem or a firmware bug. To nail down the firmware source would require reports from more users who use SDX with an MIO. Hmmm... wonder if this happens with 256K MIOs???

Beyond this, we can't go any further toward resolving your mystery in an e-mail forum like this. Somebody needs to get down with your system & give it a good going-over.

- Ben Poehland

3932. A Call to Arms :)

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-16 22:08:53 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407162208.AA279946511@relay2.geis.com>
Source record: 99659

Call To Arms: An old warrior's view...

I'd certainly never want to discourage anyone from conducting the type of campaign proposed by Steve Godun. The idea of getting the old software released is certainly a noble & worthwhile objective, with enormous potential benefit for us Classic-8 users. How many of us have protected boot disks that have succumbed to disk rot, rendering them totally useless since the parent company has either left the market or gone belly-up?

However, I feel compelled to imbue this effort with a serious element of cold sobriety. Every year or so someone in this group gets this idea & gets all fired up about it, as if it were the product of their own original brainstorm. The idea is not new & has been tried several times. Results range from an occasional success to dismal failure, accompanied by frustration beyond all human experience. Previous attempts have been sporadic in nature, lacking rigor & thoroughness.

Steve's approach does bear one novel element in that he has recognized the need for some research to compile the names & addresses of the software developers. Asking for assistance from people on the net to provide this info is a first-order approach which will backfire: Steve will waste much valuable time sorting out the many duplications that are bound to occur. And because the approach is not systematic, I'd guess doing it that way will garner no more than half the nummber of names & addresses, probably fewer. The only real way to prepare such a list is for someone with complete sets of Analog, Compute!, Antic & NAU to page thru every single issue & enter the name/addresses in a database. Between 1979-1992 I think it's a fair guess more than 500 different companies were in the 8-bit market at some time, many of them producing more than one product which must also be accounted for. This is a daunting task, & it's just the opening salvo of the campaign.

Whoever does the mailings must be prepared to expend the following resources:

1.) All your free time for one full year.
2.) $500 of your own money.
3.) Computer resources to keep track of contacts, responses, & followups.
4.) Expenditures for competent legal advice.
5.) Grossly excessive wear & tear on your nervous system.

The form letter sent to all these companies must be carefully worded.

Unless the above factors are taken into account, then Steve's campaign will end up being just another lackadaisical effort that will go nowhere & sputter out like all the rest.

I'll make the first contribution here, which will save you some trouble. Don't even bother contacting MicroMiser Software (producer of TurboBase,

TurboWord, & TurboFile). The kindest thing I can say about the guy who runs that outfit is that he's a flaming asshole. I offered the man $1,000 for rights to TurboFile & gave up in disgust after he turned 2 perfectly good contracts into chop suey. He will respond not at all to written inquiries about his former Atari products, & you have a snowball's chance in Hell of getting him to release anything.

- Ben Poehland

Post responses to the group, not to me.

Technically 16K linear at a time, but many bankswitch. Some bankswitch 8K segments like the OSS languages because the Atari is set up to expect an 8K area for AtariBasic and stuff. Some game carts for the XEGS bank out a lot. SpartaDOS X has 64K worth of info on it. I think crimebusters might have 128K. Same phenomenon in the 8-bit Nintendo world. It might be the same in the SNES and GENESIS world if their cart ports can not address more than 128K or so. Obviously with 16-bit machines normally you can address at least 16 megabytes of ram (24 bit adress bus).

As for Star Raiders, at the CES, a game caled 3-D Space War was shown. That is the working title of the SR project right now and it distresses me no end. I don't think they are handling SR 2K very well at all. Practically no info about SR-ish game play has been mentioned at all, only the 1-on-1 stuff which is cool, but is NOT and I repeat NOT SR and should not be marketed as such.

It's sad because Atari can claim to be the rightful first company to deliver a 3-D space sim, and it's about time they swabbed the deck with the upstarts.

3935. VBI's.. make it <STOP>! :)

Ok, I can now make Action! PROC's into Vertical Blank Interrupts!
RAD!

BUT!... HOW the HELL do I stop them!? ie, turn them off. A bit of code was lacking in Mike Todd's post, but that's understandable because all he did was cut out some of the STARS3D.ACT code. (The "XITVBV" location, easily found in Mapping :) and the actual 3d stars routines were refered to, but missing, so all ya gotta do is cut them out and put in your own code).

Anyways, I've found that END() literally quits the program.. no code afterwards is executed (ie:
END()
PRINTE("test") <- this never gets executed)

BUT, it does NOT seem to turn off the VBI which SETVBV() turns on!

Anyways.. I guess my next step is QUICK-style DLI coding! (just as this is very QUICK-style VBI coding, which is VERY cool :))

So.. who out there knows how to shut down a user-installed VBI !?

>green
>However, these colors are not sufficient to produce any color. Yellow is
>impossible for instance. In order to do all colors, the minimum would be:
>yellow
>blue
>red
>black

Actually, to produce _all_ colors you'd need cyan, magenta, yellow, and
black. However, pen-based technology that exists in the 1020 is _hardly_
accurate enough to do a CMYK printout without serious artifacting.
Besides, you'd have to change from ball-point ink-based pens to felt-tip
water-based pens, which would give you plenty o' smudges and generally
poor output.

>A TV has 3 artifacts. Blue, red, and green. But a TV uses additive
>color, and pens use subtractive color. In other words, a TV gives off
>light, and pen on paper reflects frequencies. So a TV can create white
>with RGB lit up and with a printer that would produce black or dark brown.

Theoretically (see notes above), an RGB mixture on paper would produce a
muddy brown.

>Is there a yellow pen available for the 1020? If there were it would
>then be theoretically possible to dump ColrView images to the 1020.

No it wouldn't; see notes above.

>It would probably take about an hour to print but it would be a lot cheaper
>than a Star NX-1000 rainbow.

At least an hour, and you'd get very crummy output not suitable for
even the simplest graphics.

>With red, green, blue, and black, (and white for the paper) you could get
>away with it. Using various dither densities and overlapping colors and
>adding black with darker shades when necessary.

No, you couldn't get away with it (see above again). Furthermore,
plotters _can't_ dither. Not accurately, anyway, and certainly not
accurately enough to produce a color separation as you describe.

>There is an ANTIC program which dumps standard pics to the 1020. This
>program could be modified for this project. Ideally you'd have to dump
>separate .R .G .Bs. However, the info might have to be converted from
>additive to subtractive before dumping. Just dumping red green and blue
>would create a mess.

No offense, but give it up. It just ain't possible, and no matter how you
slice it it won't work. I've been involved in graphic arts for over a
decade and I know all the essentials needed for creating a color image.
The 1020 falls short in all of 'em.

: >would create a mess.

^-- Have you ever seen the output of this program? If this program
hadn't existed I wouldn't have asked. Obviously the answer to the
question "can you dump a Gr.15 image to the 1020" is a yes. And
ColrViews are nothing but 3 Gr.15 pictures so the question all boils down
to pen colors and subjective qualitative judgements on the output to
determine whether it is worth it. It's just something to try on a $10
piece of hardware. I'm not trying to get laser output on it. But I'm
not about to shell out over $100 for another 9-pin dot matrix (I also have
an Epson FX-80) just to do color dumps, let alone a $4000-$600 color ink-jet.

: No offense, but give it up. It just ain't possible, and no matter how you
: slice it it won't work. I've been involved in graphic arts for over a
: decade and I know all the essentials needed for creating a color image.
: The 1020 falls short in all of 'em.

If you know for a fact that those pen colors don't exist then the point
is moot anyway. It wouldn't be necessary to dissuade me on the basis of
how it would look if it is impossible to get the necessary pens.
Certainly this is a subjective judgement, and someone who's been in the
graphic arts business obviously has a far higher standard than someone
like me who is just looking for something crude and cheap.

3938. Mario clone on 8-bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-17 01:17:33 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Jul16.211431.11302@wariat.UUCP>

I can't seem to find the original msg., but someone was saying, I think, that there isn't a Mario Bros. type game on the Atari 8-bit? Seems to me I saw Mario Brothers on the 8-bit a long time ago. Does anyone have it? I do have a thing called BROS, that is either a German commercial game or a beta version of some developer's or something. It is very Mario-like. I don't play games much, so I'm not an officianado on Mario-type games. I guess my question is, isn't there a real Mario from a long time ago and has anyone else seen the BROS. boot disk I'm talking about?

: Seems to me I saw Mario Brothers on the 8-bit a long time ago. Does
: anyone have it? I do have a thing called BROS, that is either a German

The animation was very blocky. It must have used character based
animation. I know a game like this has to use character based
playfields, but I'm just not a fan of character based players. That's
why I HATE Dandy. I don't know why people like Dandy so much. Who wants
a game where the player moves 8 thick pixels in a jump? The movement
wasn't as blocky as Dandy, but it was still pretty unplayable.

I'd rather give up color depth and put up with some flickering to use
PMGs over character animation. Or have it lag and do it all blitting
like some games do it.

3941. Mario / Super Mario games

Newsgroup: comp.sys.atari.8bit

The original thread was started by me last night :) Re: Super Cornholio Bros.
(Cornholio = Beavis, from Beavis and Butt-Head, gone mad)

Anyways, the "Mario" games out there INCLUDE (but is not limited to):

Donkey Kong - the ORIGINAL "Mario" game
Donkey Kong Jr
Mario Bros. - the old, 400/800/XL version which came out along w/2600,5200
Mario Bros. - the new, XE version which came out w/ the oodles of XEGS
games

3942. Shoot.. hit ^Z not ^X Re: Mario

Source record: 99669

Argh!
Ok, lemme start over :)

Donkey Kong
Donkey Kong Jr
Mario Bros (old)
Mario Bros (XEGS release, nicer looking IMO)
Super Mario Bros (??? I cannot verify, see below)
BROS (German "Super Mario Bros" clone which I too dislike: no P/M Gfx)

I started work on a dismal TurboBASIC XL Super Mario Bros. clone, CrashMan.
(BROS is also TBXL, compiled, with some digital sound). Mine didn't have
digital sound, used P/M Gfx (nothing was drawn, for testing I used a big blob)
but the thing got so slow, even WITHOUT enemies (which too were never added).

I DID have a spiffy editor for making the levels. It ALSO didn't scroll (like
BROS).

As re: Super Mario Bros. I dunno which Atari it was released for, all I know
is someone sent in that they got a good score on it for "Atari" to some Game
Magazine a few years back which listed good scores that peopel got (for some
ridiculous reason).

Anyways, again, that might not be ALL of them.. that's just all I know of...
oh, except "Fred" which is a Caveman version. It used P/M Gfx I believe for
the main character, but used slow blitter style graphics for the enemies, so
everything was all pretty much the same color (like Zybex and Draconus :)).
I have the PD Demo version which is probably at UMICH in one of the KESoft
demo-version's-of-games disks, but I don't think I'd really pay $$ for it..

-bill
kendrick@vax.sonoma.edu |||

HOW DO I TURN OFF A VBI ?!

It has been set with SETVBV with "7" in A register and address of routine in "X,Y" registers. It runs fine.. I can even do stuff with it like I'm supposed to be able to (hey, Rob, VBI's are really cool! Nyeah nyeah.. better than pointers!)

BUT.. I cannot seem to find any (clear) documentation on "how to turn of a user VBI".

Also, it crashes before anything happens when I tell Action! to compile my procedure to page 6 and then tell SETVBV that that is where it is. :(:(:(

hellllllllllllp! (I need somebody! Help! .. sorry :))

>BUT!... HOW the HELL do I stop them!? ie, turn them off. A bit of code was
>lacking in Mike Todd's post, but that's understandable because all he did was
>cut out some of the STARS3D.ACT code. (The "XITVBV" location, easily found in

Hey Bill, check out Mapping and DE-RE if you have em, remeber that the vbi
(deferred mode) points to a an RTI. Save this address ($224, VVBLKD) and
do a final SETVBV using the saved address prior to exit.
Sorry to have left that out...btw, I
only used the Stars3d.act source because I recall having sent it too you
a while ago

DLI's in Action! work in a similar way. DLI's are disabled to begin with,
you've got to enable them, poke $d40e,192 and the address of your dli
source is stored at $0200 VDSLST.

Do check out Mapping however, I'm taking the mem locations from memory
so they may be a bit off.

Mike

Yes, the original Mario Brothers game was released. I have it somewhere
but as I recall it only had one (non scrolling) screen. Although the
complexity of the bad-guys increased. It wasn't, however, the Super
Mario Brothers game everyone seems to have come to like.

Mike, (and all else who know), I THINK I tried a
"SETVBV(7,$E905/256,$E905&255)" to turn off the thing but it didn't work.
If this is the wrong address, please tell me.. it's within the routines
labelled in Mapping as "SYSVBL". I also tried setting it to "XITVBV" with bad
results too.

Finally, what's wrong with doing this for the VBLANK routine:?

```
PROC VBLANK=$0600()
```

which replaces the generic, "it goes where the compiler sticks it":

```
PROC VBLANK()
```

declaration. For some reason it just totally dies. I even tried adding 1 to
the location when I SETVBV'd.

FInally, the Action! guide said something about each BYTE of the parameters
passed to a function are stored in A,X,Y, then about 16 addresses (page 0 I
think).

Since Action! can't take more than 8 parameters to a PROC or FUNC, I'm
supposing the reason they said 'byte' and not 'parameter' is so that you can
stick stuff together into cards which'll let you pass more than 8 bytes.
(Or perhaps even a byte or array?)

Anyways, can't SETVBV(7,VBLANK) replace SETVBV(7,VBLANK/256,VBLANK&255) or
are the bytes backwards? (X=low, Y=high, does just using "VBLANK" as a card
stick the wrong values into X and Y ?)

Anyways.. any and all help'll be VERY much appreciated! Thanx for all I've
gotten so far!

For Sale - Full-blown Atari 800 system - Take everything for $50 + shipping.

Atari 800 (with power supply)
Atari 810 disk drive (with power supply)
Atari 1027 Printer (with power supply)
Atari 1010 cassette recorder (with power supply)
Atari Joystick CX40
Paddle controller set CX30
Teknika Monitor (model MJ-10)
All connectiong cables
Cartridges - Basic (CXL 4002), Word processor (RX 8036)
Various Cassettes and disks
Original documentation with most pieces (800,1027,1010,MJ-10)

My parents inherited this system from someone. I tried it when I visited them, and the disk, cassette, monitor, and computer all work fine. I didn't try the printer, but I'd be surprised if it didn't work. The system is in clean and excellent condition. My parents live in Lisle, Illinois, so if you're in the Chicago area, you can avoid shipping. $50 + shipping takes everything. Please reply to tjt@aloft.att.com. ...Tim Thompson...

From: kamaro_kid@delphi.com
Message-ID: <hK+QKvL.kamaro_kid@delphi.com>
Source record: 99678

I dont know.. I too have experienced odd MIO problems after upgrading my machines. For instance, I had a 1meg 130xe completely socketed, with a sound and video upgrade and much much more. Worked FINE prior to the upgrades. After installing the 1meg ram, the MIO failed to work..

I'd boot up and get a black screen. Hitting Reset/Select would give me a jumbled MIO menu.. garbage and atascii characters everywhere.

Without the MIO plugged in, the 130xe worked flawlessly.. Connecting any other computer to the MIO and it worked fine -- so the problem was a combination of the upgraded XE and the MIO.. Still havent ever figured it out.

BUT, I can state from past experiences that some MIO's did this while others didnt..

>like me who is just looking for something crude and cheap.

First, I don't know for a fact if the pen colors exist or not. But the
pen coloring alone, as I had already said, was not the whole of the
problem. In order to produce a color image you need a printer that can
produce line screens. A plotter _can not_ produce line screens, so a
plotter _can not_ produce a color image. Just like a laser printer can't
print through several sheets of carbonless since it's not an impact printer.

> Fredrik Lundholm told me.

As far as I know, that isn't true. There is someone other
than Nick Kennedy doing that. From the SIO2PC README file...

A NOTE ON A RELATED HARDWARE DEVELOPMENT

Recently, an SIO2PC user told me he was developing a hardware project
which would allow him to type on the PC and have the keystrokes
transmitted to the Atari via a PC parallel port and custom Atari interface.
The system also comminicated joystick positions, START, SELECT,
OPTION, and SYSTEM RESET button status to the Atari - AND
allowed turning the Atari on and off remotely, and turning the Atari's
cartridge on and off. His idea was to tuck the Atari away, into a desk
drawer or something, and do everything from the PC's keyboard. He
asked me to write to software for this project and integrate it into
SIO2PC, which I have done. The hardware is more complicated than an
SIO2PC, having 8 or 10 chips and requiring internal installation in the
Atari. If this sounds interesting to you, I'd be glad to send you the
schematic and a version of SIO2PC which includes the control functions
for this modification. If you'd like to contact the designer of the interface
he is Carl Mangaroni, 15764 Midwood Drive Suite 5, Granada Hills CA
91344 phone 818-363-1037.

xebec@delphi.com wrote:
: Does anybody know the answers to the riddles in The dungeon?
: (To the Gargoyle on Level 3)

I can't remember the second two, but the first is shipwreck, I think.
I tried wreck, and every word I could think of ending in eck... Then I
wrote a program which decrypted these clues and revealed that there is
stuff in the Dungeon prepared for the never completed sequels.
If you want to know how to decrypt the Dungeon disks, here's how:
The first sixteen bytes(or is it 8, I can't remember off-hand) of the disk
sector before a sequence of related sectors contain the key to that sequence.
By a sequence, I mean the sectors related to the gargoyle, or the church, or
any other place that has a picture. If I remember correctly, all you do
is take the key and tack it on to the end of itself until you have 128
bytes. Then take this 128 key and exclusive-or it with each of the
sectors following the key sector. I found the key sectors by trial and
error. I have them all written down somewhere. I could dig them up if
you would like.

Hope this was what you wanted,

-Jonathan Lee (lee912@cs.uidaho.edu)

Message-ID: <01HETNEXFA9A8Y80LK@vax.edinboro.edu>
Source record: 99686

```
There are several different version of SparaDOS.
- v1.1 Don't bother!
- v2.? Don't know much. I nkow people who like it.
- v3.2 The latest Disk version. 3.2g is now shipping from FTE.

SpartaDOS X (4.17 - 4.20):

* command line interface.
- Max BASIC Fre: about 35354 (I run at about 33815 free)
- Takes up no space on disk.
* Supports any density.
* Reset proof.

other notes:
- Can use Banked RAM on 64k+ machines.
- Can use Banked RAM and keep XE banks with 128k+ ram.
- Supports (up to) 1 meg RAM.
* Supports Hard-Drives as 16meg partitions.
- File and Sector buffers can exist in Banked or OS ram.
- Many utlities on built in 64K cart. Ramdisk.
- Will only write/format in SD and DD with Atari Format disks.
* Batch files.
* I/O redirection.
* Built in High Speed SIO drivers.
* Built in PBI drivers.
- Default Drive as D: in programs. (SDX and SD3.2g)
- built-in format menu. (can be called from any program).
- MS-DOS style commands.
- Search path. (like MS-DOS).
- Allows configuration though config.sys and autoexec.bat files.
* subdirectories.
- current path can be displayed on command line.
* Time/Date line and File Stamping.
* 32 key buffer. (works even during disk I/O).
- Optional Drive letters (ie. A: instead of D1:).
- Swap drives.
- .... and more ....

> Requires 64k and use of OSRAM.

- Applies to SDX
* applies to SD3.2 and SDX
> Applies only to SD3.2

I hope this helps.....
```

Hello User,
some days ago I received from my friend "Bewesoft" from Prag his newest software.
It is a DOS, full Sparta DOS compatible. But it has some nice features e.g. it doesnt use the ram under the rom, also it will work 100% with Turbo Basic !
The DOS is called BW-DOS and is shareware, it is some bit faster and shorter compared the original
SP-DOS. I think it will be available on the FTP in the next 8 days..

Greetings from Germany

Dieter Popp didi@didi.mayn.sub.de

I made a simple unelegant fix for my VBI problem.. stick a RESET() at the end
of the program (RESET = $E474).

Now my problem is (and I've had this often :)) where to stick my chsets.
I'm still fuzzy on how location 106 and 741-744 and some others work..!
Mapping uses "above" and "below" a lot, but I'm not sure whether "above" means
"locations with larger (higher) values" or the opposite!

Can someone help me?

So far for a font (I'm having very few redefined characters, but two sets, so
2k) I just find some place in RAM to set a pair of bytes, then do:

```
MOVEBLOCK(MYSET1*256,224*256,1024)
```

and to change stuff, I do this:

```
MOVEBLOCK(MYSET1*256+(char*8),"blahblah"+1,8)
```

for each character. Not the quickest or most elegant, but it WORKS and it's
only done once in the beginning, so it's good enough for me :)

Now.. how do I go about finding what "MYSETx"s should equal!?
I did this:

```
BYTE FRE=106
...
MYSET1=FRE-16 (and -20, and -24, and -30, and so on)
MYSET2=MYSET1-4 (4 pages=1k, so in essence the first font in RAM is set2,
but it doesn't matter at all)
```

Also, At the moment, I'm using MOVEBLOCK() calls in my VBI.. stupid, huh?
I think using CARD movement should speed that up (and shrink it!), no?

Hello ATARI GUYs!!

I have one question on using Atari. I don't still have
ATARI, but I will get it soon. Yeah, I have one question.

I think that when we expand disk drive on Atari, we use
SIO usually. Therefore, if terminal soft is saved in disk and I
want to send data from amiga to atari on serial port, what do you
do??

I think it is simply and stupid question, but let me know.
I have data downloaded from UMICH yet and it is saved in AMIGA. It
is too hard in Japan to get periferals(BlackBox and so on) of Atari,
if I can so without other periferals, let me know.

Thanks for your reading my English!! :-) \(^_^)/

>labelled in Mapping as "SYSVBL". I also tried setting it to "XITVBV" with bad
>results too.

I'm a bit rusty here, but that doesn't look like the right address to
me - in the XL appendix to Mapping, $E905 is in the middle of a
"Peripheral Handler Loader" initialization routine (see p. 224 of
revised Mapping). You are using an XL, aren't you?
(The 400/800 section does mention $E905 in reference to VBI's,
though.)
If you want to stay legal for both 400/800 and XL/XE, you should use
the addresses from the vector table at $E450-$E4D7, but to see where
those routines go on an XL, look at p. 222 of the revised Mapping.

It seems to me that you need to save the old values of the locations
you're changing to point to your routine, then restore the old values
to stop.

>Finally, what's wrong with doing this for the VBLANK routine:?

I don't see why that wouldn't work, unless you're referencing $0600
somewhere else.

>FInally, the Action! guide said something about each BYTE of the parameters

[...]
>Anyways, can't SETVBV(7,VBLANK) replace SETVBV(7,VBLANK/256,VBLANK&255) or
>are the bytes backwards? (X=low, Y=high, does just using "VBLANK" as a card
>stick the wrong values into X and Y ?)

Using plain VBLANK would put the low byte into X, high byte into Y.
Doing the VBLANK/256,VBLANK&255 would put the high byte into X, low
byte into Y. (if the order is A-X-Y)

Maybe I'll learn a little about VBIs here.
BTW, many of those tables in the OS are just arrays of *pointers*. :-)

From: lordthan@news.delphi.com
Message-ID: <30cvp9$irk@news.delphi.com>
Source record: 99694

Thanks to the concerned effort of _ONE_ user, I've got a good list
started of Atari 8-bit software developers of the past. These are (so far)...

Adventure International
Activision (Imagic)
Allen Macroware
ALOG Computing
Alpha Systems
Amulet Enterprises
Arrays, Inc.
Artworx Software Co, Inc.
Avalon Hill Microcomputer Games
Big Five Software
Bram Inc.
Broderbund Software (Synapse Software)
CDY Consulting
Datamost
Datasoft, Inc. (Intellicreations)
DonUt Ask Computer Software Inc.
Tronix Publishing, Inc.
Eastern House
Eclipse Software
English Software Company
LJK, INC.
LJK Enterprises, Inc.
MicroProse Software
Mighty Byte Computer
MMG Micro Software
Monarch Data Systems
Muse
Newell Industries
Penguin Software
Planetary Machine Intelligence (PMI)
Programmers Workshop
Quality Software
Reston Publishing Company
Roklan Software
Royal Software
Sierra On-Line
Strategic Simulations Inc.
subLogic
Synergistic Software
XLENT Software
Swifty Software, Inc.

That's about 40-45 companies so far, but I _know_ there's more. I notice that Atari Corp. itself is not on this list. Also conspicuously missing are Infocom, Synapse, Microsoft, Bank Street Software, and Epyx -- as well as many, many others, I'm sure.

So how about it, folks? Anyone else want to get off their butts and look for the addresses for the companies I need to make contact with? Or is this going to be another example of the _generally_ lazy behavior that I remember Atari users to be notorious for? :/

I've already printed out letters and agreements for those above companies. Please don't make me throw away ~90 sheets of paper.

Help, in other words. Be useful. Help out.

Look up in Mapping what the OS does to VBIs during RESET, then do that
yourself instead. That would be a bit more elegant.

>Now my problem is (and I've had this often :)) where to stick my chsets.
>I'm still fuzzy on how location 106 and 741-744 and some others work..!

>Can someone help me?

Think of "above" and "below" in terms of "high memory"-> $FFFF and
"low memory"-> $0000. So $0600 is below $0700.

>So far for a font (I'm having very few redefined characters, but two sets, so

Why Are you moving the whole set, rather than just pointing CHBASE at
MYSET1? You already have your set in memory - it loaded with your
program. The hard part is making sure it begins on a page boundary,
but that isn't all that hard. You're still stuck thinking as a BASIC
programmer!
Besides, doesn't your first line above attempt to move your set on top
of the ROM (as in Read-Only!) set? Or am I looking at MOVEBLOCK
backwards?

>Now.. how do I go about finding what "MYSETx"s should equal!?
>I did this:
> BYTE FRE=106

> but it doesn't matter at all)

To be more accurate (or clear), you might want to change "FRE" to
"RAMTOP". Like I said above, it shouldn't be necessary to reserve
space like this, but if you insist, you might want to assign FRE to
point to the bottom of the character sets. Why are you taking 16
pages for MYSET1 if you only need 4 for a set?

>like H1:) or how it is organized ?
>
SpartaDOS handles hard disks in the exact same manner that it handles
floppy disks... D1:, D2:, D3:, etc.
SpartaDOS uses a subdirectory system which resembles MSDOS. It is a
"command line" driven system in which you type commands like COPY, FORMAT,
DIR, CWD (change working directory), rather than just choosing an option
from a menu. This has the advantage that new commands can be added to
the system easily. There is a core of commands which are contained in
the actual SpartaDOS OS, and all other commands are external modules.

The system is really designed to run via a HD or a RamDisk.

To add a hard disk and use SpartaDOS, you would have to have either an
MIO or Black Box. There is a file called HDPHFMT which formats the drive
in 256 byte sectors physically, and then you run a second command file
which formats the drive and lays down the directory. From that point on,
the drive looks just like a huge double density floppy. On an MIO you
can have up to 16 meg sections (called partitions) as a single drive.

SpartaDOS also supports time/date stamping using either an internal clock
or the R-Time8 clock. That's really handy when you need to check to see
if the file is of recent vintage.

I ran a BBS using SpartaDOS on an MIO with 60 megs of HD space for 8
years. It ran flawlessly and reliably. It would still be up if we
hadn't switched to an ST system.

3970. VBI's and stuff

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-18 07:33:38 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940718003346.2400132a@sonoma.edu>
Source record: 99696

Ok, UP is bigger.. ok :)

I'm moving "the whole set" from ROM into RAM twice. Once for set one, the other time for set two. The syntax of the Action! MOVEBLOCK() procedure is:

Moveblock(card destination,source,length)

So MOVEBLOCK(MYSET1*256,224*256,1024) moves the ROM set into the MySet pages.

The reason MYSET=FRE-16 is because screen RAM and stuff is just below (behind, before, whatever) where FRE points to.

ie, if I go into Graphics 8 and put a ChSet at FRE-16 it'all appear in the middle of the screen. Since I'm using Graphics 0 only, it's before the graphics 0 'top of screen'.

I subtract the other 4 for the obvious reason that I don't want the other chset within the first one :)

I dunno where to look before I do a SETVBV.. Is it in page 2 somewhere? Btw- i HAVE no newer Mapping! I have only the 400/800 and it was like the last one at BEST or B&C or wherever I got it! It does mention the diffs between the older and newer (rev.B) OS ROMs for the 800's (I guess).

Anyways, what exactly does SETVBV() do? EXACTLY... it sets some "User deffered-VBI is on" bit, waits for the appropriate time to set some VBI pointer to my routine, does it, and then that's it? Am I right? Anything wrong? Anything missing? Too much added!? :)

Who around here is an absolute EXPERT at VBI's!?

One thing I'm beginning to dislike about Mapping is comments like:

"then do a JMP to <some hex location> (<decimal version>)" .. no reference to the location's NAME!! :(:(:((like "SETVBV" or "XITVBL" or anything!)

Oh well..

Thanks for the help SO far!

3972. XEP80 question

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-18 08:39:30 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <30df43$jtf@usenet.INS.CWRU.Edu>
Source record: 99699

Where is the XEP80 handler load into
memory at? I have been working on a
40/80 column editor. It works with the
normal 40 column editor, my super fast
80 column handler. I would also like
to have it have a chance of working with
the XEP80 device. The editor only requires
(strike that last partial sentence)

It currently only is a program type editor
(no lines longer than 128 characters).
It is similiar to actions. It has horizonal
scrolling of lines (like action).
Supports up to 16 XE memory banks. It is
capable of treating them seperately or saving
and loading them as one contiguous file.
You still have to use bank select commands
like Atari Writer Plus XE version though.

I also will work up a fast 40 column handler.
The program does as minimal writing to the screen
as possible for speed reasons.

Sorry for the additional commentary to a simple
question, but I thought some might be interested in
what I am working on.

> for composite?

For all intents and purposes, composite IS tv surely? I see what you
are getting at but AFAIK the RF signal is just the composite signal
modulated onto a carrier. I would guess that the extra scanlines are
added BEFORE the signal is output in composite and modulated. Unless
someone knows different that is.....

If you have a good monitor you might be able to adjust vertical hold
to compensate for the extra lines.

>addresses in an attempt to get legal permission to distribute the
>software via an ftp site. I have yet to receive a single reply to that
>ad, so I suppose that the Atari community simply doesn't want 'em.

Perhaps most of us are more interested in all the new commercial and
shareware releases, rather than gaining access to the old, outdated stuff.

>It's kinda funny, actually. With no bashing intended (this is _purely_ an
>observation), I've found that out of all the computing circles I've been
>involved with, the Atari community is by far the laziest.

I don't know, someone who posts "If you guys do all this work for me first,
then I'll do this for you" might be perceived as lazy as well. Perhaps
you'd have more luck if you found some addresses, then asked us to write
letters?

A number of us have written companies in the past. Usually they don't
bother to respond at all, although of course there are exceptions.

aa700@cleveland.Freenet.Edu (Michael Current) writes:
>Perhaps most of us are more interested in all the new commercial and
>shareware releases, rather than gaining access to the old, outdated stuff.

Then why, praytell, is there so much talk on this newsgroup about
"classic software"?

>I don't know, someone who posts "If you guys do all this work for me first,
>then I'll do this for you" might be perceived as lazy as well. Perhaps
>you'd have more luck if you found some addresses, then asked us to write
>letters?

Excuse me, but I think you're _way_ out of line here and frankly I expect
an apology over that implication. I've offered to spend the money on
stamps, take the time and effort to write letters, contact a lawyer to
create a legal agreement that the companies can sign so that distribution
is allowed without legal recourse (not to mention paying said lawyer),
and locate a host FTP site for the resulting files. And now you're
accusing me of being lazy, just because I haven't the foggiest idea what
anyone's addresses are? I resent that strongly. I haven't seen _anyone_
here, past or present, try to put that much effort (and time and money)
into a project that will benefit the entire Atari 8-bit community. Awhile
back I gave all of my old Atari 8-bit-related magazines to someone (yes,
GAVE, as in, FOR NO MONEY) so I no longer have a source of looking up
addresses and the like. The local libraries don't carry _anything_
relating to the Atari. I've been out of Atari 8-Bit-Land for several
years and, as such, would be unable to look through the FAQs becuase I
wouldn't know who produces hardware and who produces software. So YOU
tell ME, sir, how the flying fuck am I being lazy over this. (Yes, I'm
pissed off. Sue me.)

>A number of us have written companies in the past. Usually they don't
>bother to respond at all, although of course there are exceptions.

First, let's understand something. I remember the times when I was
actively involved in Atari 8-bit computing (as a primary computer). One
of the strongest memories I have is that trying to get a group of Atari
users to execute one concerted effort was next to impossible, and from
the looks of things (and the attitude I've gotten from you) it seems
things haven't changed much. So asking a bunch of people to write letters
to various companies is (a) not going to happen, (b) not a legal effort
to allow the software to become freely distributable, and (c) as a
result, very likely to fail.
Assuming I get some assistance (rather than attitude), this effort - MY
effort, as it stands now - will benefit everyone. Scant few people who
use this newsgroup can say the same. Yet you say I'm lazy.

You have _absolutely_ no clue about this. The time you spent telling me
that I was lazy _could_ have been spent finding an address for, say,
Infocom. But no, you'd rather tell me that I'm lazy. With the respect
this type of attitude deserves and until I see a public apology from you,
fuck you.

Hola mundo.

I've seen a lot of atari stuff (even in the archive) that somewhere
says "(C) 19xx by ...". I guess that many of them aren't copyrighted.
Why? Just because it seems to be difficult to copyright something
(at least here in Chile).

I know that some programs published in magazines inherited some
copyrights... the same to some major software publishers.

Am I wrong?

Now, what I have to do to (C) my own programs?

Bye... ++Vitoco

Does anybody know if there is an online publication which has a list of the Atari OS error codes? I got my Atari 800 used, and it came with a book called "Using your Atari 800" which has a spectacular appendix FILLED with the OS error codes. Unfortunately, the book is falling apart, (Chapter 10 is now living somewhere other than inside the book. :D) and I STILL need the Error codes. I can never remember if 170 is File Not Found, or if it's Device Not Answering. Please help! If I've just been ignorant and the error code table is in the FAQ, please don't flame me *TOO* badly. Thx! :-)

I tried emailing this a week or so ago, but it didn't work.
You're email addresse bounced beautifully.
So here it it as a follow-up.

Matt,

Spartados is a command line processor DOS system. This means it works
very much like MSDOS or Unix. SpartaDOS consists of a resident
command line interface with some internal built in commands, and
an infinitely expandable number of external commands via .COM files.

Since there is no DUP.SYS to load to get to the internal command line
interface, you can jump back and forth from a cartridge or BASIC and DOS
very quickly. SpartaDOS also takes up less memory than Atari DOS 2.0
by hiding much of itself (in versions 3.2d and 3.2f and 3.2gx)
under the OS ROM.

SpartaDOS has its own disk structure, not compatible with Atari DOS or
its clones. Though SpartaDOS can read and write to an Atari DOS disk,
Atari DOS can't read or write to a SpartaDOS disk.

Because of this disk structure, SpartaDOS can support subdirectories.
Each file or subdirectory also has a time and date stamp.

SpartaDOS also supports batch files. With the cartridge based SpartaDOS-X,
these batch files support parameter passing as well.

So for instance, you could have a batch file called MOVE.BAT which looks
like:

```
COPY %1 %2
ERASE %1
```

and from the command line you would type:

```
-MOVE D1:OLDFILE.TXT D1:DOCS>NEWFILE.TXT
^ ^
| |----------a subdirectory
|
|-----------a minus sign preceeds the name of a batch file
```

in spartados to tell DOS that this is a batch file, and
not MOVE.COM.

Hard drive support is available via a hard drive interface.
The ones that have been available are the MIO from ICD Inc., the
Supra Hard drive interface,and the Black Box from Computer Software
Services. All of the above provide a SCSI (Small Computer Systems Interface)
port for connecting hard drive mechanisms. You can directly connect

am imbedded scsi drive, or get a SCSI to MFM or SCSI to RLL converter card
(Typically the Adaptec 4000 or 4070) to hook up older MFM or RLL hard drives.
Each of these hard drive interfaces, the Black Box, MIO, or Supra
have their own hard drive formatting and partitioning software.
Compatible with various hard drive mechanisms varies between interfaces.

SpartaDOS can support any sort of storage device up to 16 megabytes in size.
It's up to the hard disk interface software to format the hard drive,
partition it into chunks of 16 megabytes or smaller if necessary,
and write the basic SpartaDOS disk structure to each partition.
After that, SpartaDOS merrily sees it as anything else.
Hard drives have disk numbers just like floppies do.
So you have to share the floppy drive assignments D1: through D8:
with hard drive partitions.
SpartaDOS X, the cartridge based SpartaDOS adds support for D9: for
Ramdisks.

The Black Box has a built in sort of partition manager. Up to 256 partitions
can be made, and this list of paritions and names to the partitions can
be stored as a file on the hard disk. Partitions can be brought
"On Line" and assigned to any of the D1: through D8: drive assignments
that SpartaDOS would see.

SpartaDOS-X being a cartridge takes up even less space, since many
commands are stored in the cartridge ROM. It has an additional cartridge
socket on itself to plug inadditional cartridges.
SpartaDOS-X supports a search path. You can designate a list of drives
and subdirectories that the command line interface searches everytime
you type in a command, so that it goes looking for
the .COM and .BAT files wherever you've hidden all of them.
I find this VERY USEFUL inaddition to the parameter passing in batch files
for SpartaDOS X.

Both SpartaDOS and SpartaDOS-X support the RTIME 8 cartridge, which is a
battery backed real time clock. It reads this and uses it to time date
stamp files written to disk. A macro in Textpro also allows me to automatically
time and date stamp my letters or whatever else as part of the heading
of a letter. It's quite nice.

Hope this helps. Any questions?

I don't know about Chile, but the way I understand US copyright law
(which _mostly_ corresponds to some international standards), All you
have to do to copyright something is to put a copyright notice on it.
I do seem to remember something about "(C)" not being sufficient,
though. I think you get more protection if you register somewhere.
You _might_ be able to get some info from ftp.law.cornell.edu
(or www.law.cornell.edu if you can do WWW).

170 is file not found. (I got that one so much I have it memorized,
but I checked to make sure I don't make a fool of myself.)

I wonder if there would be any copyright problem with putting the
info from the ANALOG pocket reference guide online. Most of it came
from DE RE anyway. That little folded up piece of paper is one of the
most important pieces of paper in my Atari collection.

It's not the function keys I want, it's the 1200XL keyboard itself. I kinda doubt that file will work for an XL/XE because the keyboard socket is different in the XL/XEs. I think I'd blow up something if I tried it. But since we do know the lines on the 800 keyboard (I hope) and we do know the XL/XE lines (I hope) if we use that text file and cross reference 800 > XL/XE maybe we can see if it will work and if not how to MAKE it work.

As my understanding of current _US_ copyright law goes, you have to do nothing. What written work you produce and publish is copyrighted to you by default. You are wise to include a copyright notice to indicate who the owner of the copyright is, and what the effective date of the copyright, but I don't think this is _required_. You _can_ in addition, however, register the copyright by sending a copy of the work to the government (now I am in over my depth).

(Also, Update On Refunds & Developments With The New AC)

Referring to Jeff Potter's recent post ("Andy Floyd's CSYA and Atari Classics"), I'd like to offer some updated information & clarification.

Jeff indicated that in the event Andy's unpublished manuscript was forwarded to either CN or the new AC, he didn't believe either publication would offer author stipends. The Staff of AC was disbanded in May, so Jeff has not been privy to the behind-the-scenes efforts & negotiations involving the shutdown of AC & the startup of the revived publication, which have been handled privately by me.

Policy at Current Notes is set entirely by its Publisher, Joe Waters. CN's 8-Bit Editor, Rick Reaser, has little or no say in matters pertaining to author compensation. Presently CN's policy is to reward contributing authors with a single-issue extension of their subscription, plus I think a gratis copy. I'm not aware of any changes in that policy. I doubt if it has been liberalized, as CN (like most Atari magazines), has been on the decline in recent years.

AC's policy was to reward authors of minor articles (usually "advocacy"-type pieces) with a 1- or 2-issue extension of their subscription plus a gratis copy. Authors of major feature articles were rewarded with a $25 cash stipend plus a gratis copy. Editors on the AC Staff were required to submit 2 articles per year & also subscribe to the magazine in order to maintain their Editor status. Editors were not compensated on a per-article basis like authors but were paid a flat fee of $200 per year which covered the value of their contributions plus their out-of-pocket expenses for phone calls, e-mail, postage, disks, etc. Editors also received 5 discretionary copies of each issue, mainly used for promotional purposes.

I've submitted a copy of AC's Publication Manifest to Jim Hood, the future Publisher/Managing Editor of the new AC, so he has a fair idea of how AC operated in the past. In direct communications with him I've secured his commitment to maintain the author policies that stood AC in good stead so well during my tenure. The probability is therefore extremely high that future submissions to the new AC *WILL* be compensated via subscription extensions, gratis copies, & cash stipends as described above.

My link to the SLCC people has been through Bob Woolley, who was a member of the old AC Staff. Bob has been in town the past week on business (in fact is staying at a hotel only a few miles down the road from me). His work schedule is horrible, but he stopped by my place for a few hours last week & we did make arrangements for transferring the stock of back issues to California in the near future. I'm hoping to see him one more time before he leaves later

this week, so we can discuss plans & ideas for the future of AC over dinner.

At their end, Jim Hood has secured publishing & printing facilites that will permit them to produce AC far more cheaply than Unicorn did it. This is an absolute necessity, since the way things are shaping up the new AC may have only half the number of subscribers the old one did. Their next step will be to negotiate transfer of the 2nd Class Mailing Permit presently held by Unicorn. They've not yet begun to assemble a staff, solicit articles, or commence promotional activities. Bob indicated (rather weakly) they were still hopeful of launching a July issue, but that's wishful thinking. They'll be doing well to launch in August.

In comparing notes with Bob, it appears there's a strong correlation between the number of subscription orders received by the new AC & the number of refunds issued by the old AC. Apparently a significant percentage of former AC subscribers are delaying subscribing to the new publication until they've got their refund in hand. This has hobbled planning for the new AC. The mail I've received in response to the refunds thus far consists mainly of expressions of amazement that people really did get their money back, which tells me most people did not believe the refund policy described in my editorial in the April issue. This has caught me somewhat off-guard, but given the many rip-offs & bad experiences with Antic, ANALOG, & AIM I can certainly sympathize with the general skepticism.

The real culprit here is Unicorn, who are taking their darn sweet time doing things. They agreed to have the refunds completed by August 1, but so far only 132 have been issued. We have 220 more to go & only a few weeks remaining. Since June I've contacted them numerous times to "encourage" them to speed things up. (Those of you who know me personally have some idea of what it means when I feel compelled to lean on people, especially the 4th, 5th, or 6th time. The grumpy Alchemist is an angel by comparison. And anyone who ever subscribed to AIM has an inkling of the agony of frustration I am enduring.) I spoke with Bill Rayl personally last week & obtained his assurance of Unicorn's commitment to complete the process by the agreed-upon date.

I'm just as busy now as I ever was during AC's publishing days, fighting the rear-guard action against Unicorn in behalf of AC's unrefunded subscribers while simultaneously providing a conduit of support for the fledgeling operation now underway in California. AC maintained a clean record of integrity & fairness unmatched by any other magazine, & by thunder I *WILL* pass that legacy intact to Jim Hood, come Hell or high water.

Gee, sorry, Jeff. I thought you were helping because you _wanted_ to help, not because you were in search of praise. My mistake.

But anyway, those few people who have contributed to the address list so far have been noted, and if/when this plan works, those people will be publicly acknowledged. So your ego will be stroked, Jeff. Never fear.

The one that flopped for sheer lack of interest? Yes, I am. It was laughable. Almost as laughable as that "Atari Revolution!" thing several years ago which promised things like David Letterman referrals and national user advertising campaigns.

Hey, I'm just _one_ user with a lawyer, a couple of bucks, some free time (which I've made free for this task), a computer with a laser printer, and a now-dry-and-gross-tasting tongue (envelopes and stamps are gross). Approximately fifty companies will be receiving letters and agreements in the next few days. If anything comes from it, fine; it benefits everyone, including those that would rather sit back and shoot me down rather than help out. If nothing comes of it, that's fine as well; at least I know I made the effort to contact them.

>years ago which promised things like David Letterman referrals and
>national user advertising campaigns.

Laughable? Really Steve? Mailing over 1,500 packets of literature
is considered a laughable project compared to your grand and worthy
project eh?

Let's see, during the "Laughable" lifespan of Atari Classics,
articles were published covering Super Video 2.1, An Audio upgrade fix,
The AtariWriter 80 Auxiliary menu, Textpro macros for inkjet printers and
mailing labels, Using Daisy Dot III including with a laser printer,
CORRECTLY making Black Box cables, programming using an 8 bit C compiler,
Michael ST. Pierre's GENLOCK board, color tuning your computer,
TTL video output for your 8 bit, using a multisync monitor, and more.

When you look at all the USEABLE information and programs
that Atari Classics was responsible for putting into the hands of
8 bitters, and you compare that to the likelihood that your efforts will
at best result in a few games being released into the public domain,
which effort turns out to be more laughable Steve?

At its heart, Atari Classics was a survivors' emergency medkit
for 8 bitters in the nineties. It was a magazine that focused on
keeping the 8 bit computers as productive, up to date, and viable as
possible. Realistically, what will your project do? Get a few
Infocoms into the public domain?

Will Turbofile and Turboword be released and rewritten
by your efforts? How about Paperclip, or Atariwriter 80?
Ya gonna get XLENT Software to release their database program and
update that? Is Alpha software on your list, and will I see something
NEW and IMPROVED come out of this?

How is your project gonna help keep the 8 bit computes
productive, up to date, and as viable as possible?
Atari Classics gave us better video, better audio, better ways of
using our word processors, more options when purchasing a printer.
Can your project compare?

Jeff

I'll jump in for a minute;
proc vbi=$600()
code
code
etcetera
doesn
do what you want (Bill) just exactly what you said. In Action! systax, you said I've got a routine at $600, but the compliler still generates all the code starting from the end of the text buffer. No where near $600 unless you have a very special Atari. You really have to learn to use the monitor for things like doing print outs of variables/procedures/mem dumps. Tedious but well worth it. What you wanted to do was:
set 14=$600
set $491=$600
proc vbi()
set 14=somewhere safely above your text buffer
set $491=ditto
proc blah_blah()
etcetera.
Nothing wrong with using a moveblock() in your vbi as long as it's not switched off, something like the routine from the pd library.
When you build your final program, you'll have to compile all the parts seperately then build them with the DOS COPY /A, but certainly well within your talents.
If you want to take it to E-mail, my ricortes@mocten.com seems to be down, you could still get me at ricortes@garg.com though I think. Sorry I can't help to much, but I'm booked solid for the next 6 weeks.
Rick

In the referenced article, on 07/18/94, LORDTHANATOS@DELPHI.COM writes:

LT> So how about it, folks? Anyone else want to get off their butts and
LT> look for the addresses for the companies I need to make contact with?
LT> Or is this going to be another example of the _generally_ lazy
LT> behavior that I remember Atari users to be notorious for?

Ordinarily, I wouldn't involve myself in a task that is probably going
to fail, but your comments touched me. So here is my contribution.

In the early '80s, Addison-Wesley published a series of books called
"The Addison-Wesley Book of Atari Software 198x." I bought these books
for several years, but in the end, only kept the 1984 edition ('cuz it
was the best.) In the rear is an appendix of all of the names, addresses
and phone numbers of _ALL_ of the publishers. It is 4 pages long, 3
columns up. I would be willing to mail you a copy of these pages if you
would send me an address.

Here's a sample to convince you:

Acorn Software
634 North Carolina Avenue
S.E. Washington, DC 20003
(202) 544-4259
(Lost Colony, Everest Explorer)

Activision, Inc.
5221 Bayshore Frontheg Road
Mountain View, CA 94039
(408) 942-1370
(River Raid, Kaboom, Chopper Command)

Advanced Computing Enterprises
5516 Rosechild

Do any of you AR fans have the Dungeon editor program? It was written by a guy out in Illinois who ran a BBS with a name something to do with the word "fox". It's a bit stinky to offer it, since I don't have my 8bit set up right now, but you may want to try to track it down. Though it would be a pain in the neck to get my atari together, it may help those who've suffered frot he Devourer. I also have maps to the levels and some other stuff. It's all on 8bit disks of course....

Rather than get into a flame war over your heavy sarcasm, I'll ignore it.

I never claimed my "project" was anything oh-so-grand-and-worthy that people should bow down before me or shower me with praise. This is simply something that I want to do that will, if successful, benefit all Atari users. Is there something wrong with that?

As far as Atari Classics is concerned, yes, I consider that to be a laughable project. Where is it now? What happened to it? The fact of the matter in the Atari community is this: Unless you have one dedicated individual working towards a goal, the effort will fail. Any time you have a group of Atari users who collectively start and attempt to maintain a project, it will fail. History has proven this, with a small handful of exceptions.

And how about that "Atari Revolution", eh?

And _please_ don't turn this into the start of Atari bashing as I've had enough of that silliness on c.s.a.advocacy.

In a previous article, vparada@tuetue.inf.utfsm.cl (Victor Parada G.) says:

>I've seen a lot of atari stuff (even in the archive) that somewhere
>says "(C) 19xx by ...". I guess that many of them aren't copyrighted.

Copyrighted software that is freely distributable (and thus can appear on the
Archive) is known as either freeware or shareware. Software that is not
copyrighted is in the public domain.

>Why? Just because it seems to be difficult to copyright something
>(at least here in Chile).

Assuming Chile belongs to the Berne Convention Treaty (the prevailing
international copyright standard most countries belong to, and the U.S.
finally got around to joining in 1988), you actually don't have to do
anything. Once you've created something, it's your intellectual property
until you declare otherwise. Placing a copyright notice on (or in?) your
software shows your intention to hold on to your copyright, and, at least
in the USA, you need to register your copyright with the federal government
if you plan to take someone to court over infringement of your copyright.
This can technically be done even after infringement took place, but you're
safer to register ahead of time.

>I know that some programs published in magazines inherited some
>copyrights... the same to some major software publishers.

I guess I don't follow you here. Software publishers, including magazines,
usually obtain ownership of software before publishing, but it depends on
the individual agreements made with the programmers.

>Now, what I have to do to (C) my own programs?

Attempted to answer above. :)

Probably not, if the same information could just as easily be collected
from other sources. Their own collection of the information could fall
under copyright, but if the information itself is not original to them then
it cannot fall under copyright.

What all is in their pocket reference guide? Sounds like a possible good
addition for the FAQ List.

Source record: 99743

In a previous article, lordthan@news.delphi.com (LORDTHANATOS@DELPHI.COM) says:

Steve, here's what I don't understand about the way you're proceeding.
Sure, we can all go through old magazines, etc., and send you addresses of
companies that produced products for the 8-bit Atari 5,10,15 years ago.
But that's just it, those are all old addresses! Most of the 45 companies
you listed the other day don't exist now. Most of your letters will be
faithfully returned to sender by the post office. I've chosen not to
provide you with old, invalid information because it would be a waste of
time and effort for both of us.

At least as big of an issue as renegotiating the rights to old software, is
locating who owns those rights! Old addresses aren't going to be useful
for that purpose very much of the time. Copyright may have been
transferred to a company that is still around, it may be held by some bank
somewhere, some former CEO, or perhaps the original programmers. We have
no way of knowing without doing a lot of research, where every case is
different.

There's still the question of why any copyright holder would consider
relinquishing ownership because one person and his lawyer asked. I've
always seen such a project as this being headed by Atari Classics, which at
least can make some claim to speak for a substantial portion of the 8-bit
user community. If I were Trip Hawkins, I might pay slightly more
attention to a letter from Atari Classics (and its several hundred
subscribers) than a letter from Michael Current. Perhaps this would be
even more true for someone with zero familiarity, like a bank official.

But why push for release into the public domain? Why not purchase the
commercial rights, and sell the software? A number of people have been
doing this, including FTe, Richard Gore, the Atari Classic Programmer's
Exchange, etc. I find this possibility more appealing than pushing to
eliminate all future commercial sales of these apparently still valuable
programs.

>I thought the 65XE didn't have a PBI or ECI, which was why Atari
>didn't release anything for the ECI -- they had to support _both_
>current machines.

I *COULD* be wrong (wouldn't be anything new <g>), but I seem to remember hearing someone on here say that some of the later models of the 65XE had the ECI connector, but that most did not.

Ego, shmego. I didn't even know if you received the darn thing.
E-mail isn't public, so I didn't want credit. And then start
attacking the efforts Jeff McWilliams? To what purpose?

Recognition isn't necessarily credit. It's knowing you're help
got where it was supposed to and was appreciated.

Oh I wanted to help, but if your attitude extends to the
companies you wish to reach... We might all be worse off.

```
CAIN Atari Fun Fest 94
----------------------

UPDATE: Atari Corporation will be donating -=- 3 Jaguars -=- and
-=- 3 Tempest 2000 Cartridges -=- to give away at the CAIN Atari Fun Fest.

There will be other prizes being donated to raffle off at the show.

If you aren't doing anything on August 7, 1994, you may want to stop by
Kirtland, Ohio for one of the greatest Atari gaming shows!

CLEVELAND, OHIO is within 500 miles of half the population in the United States
and a very LARGE population of Canada.

The CAIN Atari Fun Fest 94 will be held in Kirtland, Ohio (very close to
Cleveland) and will allow Lynx and Jaguar owners to have a lot of fun!
There will even be a "Cleveland Lynx-Up" where Lynx owners can bring their
Lynx and game cards and comlynx with other players! Who says that you'll never
get the opportunity to comlynx???

There will also be dealerships attending this show that will be more than
happy go give you great deals on game systems and game cartridges!

If you are an Atari computer gaming fanatic, not to worry! There will dealers
there to supply you with all your computer gaming needs...

ALL INTERESTED ATARI DEALERSHIPS AND USER GROUPS SHOULD CONTACT THE SHOW
ORGANIZERS AS SOON AS POSSIBLE! Great spaces are on a first come basis!
Atari user groups are given tables for free!

PLEASE distribute this on BBSs, networks, and at your user group meetings!
We want to have one heck of a gaming day! And a gaming day that might be
closer to you than you think!

CAIN Atari Fun Fest 94
----------------------

Central Atari Information Network
Presents
C.A.I.N. Atari Fun Fest 94
August 7, 1994 / 10:00AM to 5:00PM
Knights of Columbus Hall
7637 Chardon Road
Kirtland, OH 44094
```

4023. value of Bounty Bob Strikes Back

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-19 20:22:46 UTC
From: dgb@owlnet.rice.edu
Message-ID: <30hcmm$307@larry.rice.edu>
Source record: 99753

What is the value of a Bounty Bob Strikes Back cartridge
(without box, manual, etc)?

Any more than, say, Pac-Man or Star Raiders?

I'm asking since a few months ago there seemed to be a
rash of conversation about the game.

4024. Hmm.. SURE IS QUIET AROUND HERE! (sarcasm)

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-19 21:58:06 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940719145353.24002d33@sonoma.edu>
Source record: 99754

Yikes! I can't believe the tension around here lately! WHat's up with everyone these days?! Screaming back and forth when it seems simple, UNSARCASTIC, HONEST comments are all that's needed to end these miserable shouting-match threads!

I'm not going to name names.. I mean, anyone who reads here can plainly see what's going on! :) We've got yelling over the XF2 still (WHY!? I dunno! I'm going to post rev. 0.2 again today.. I haven't added anything lately), now we've got screaming about getting old addresses, and then in the middle are the odd messages about VBI's (thanks Rick :)), FlickerTerm, Ice-T and SpartaDOS, but I mean.. it looks like we all need something to DO (either on our little 8bits, on our puny little IBMs <grin> or just like go to a park and cool off all this TENSION!!!! AHHHH!)

I hate to see this (what I consider, very COOL (in the 80's sense)) newsgroup turn into a flamewar. I've heard about Terry Ortman (anyone who has dealt with him even a LITTLE, like ME, knows how this guy can be!) on one of the Atari BBS networks being about all there is to read (him being a dork, and others getting on his case for being such a dork and so on).

We've got all this COOL stuff to worry about lately! Ice-T, FlickerTerm, SpartaDOS releases, MARS8 FOR CRIMMINY'S SAKE!, R:P:Connection (WHEN IS IT COMING OUT!? <$grin$>), new games like the Wall (check it out if you havent) which are using ColorView style graphics modes! (What many games seem to NEED) and a lot of other stuff (sure, XF2 and the mail-the-old-companies campaign are included - unfortunately the only POSTS about them seem to be complaints!)

Sooooo.. why don't we start talking more about some of ^ THAT ^ stuff rather than sticking to the old arguments over the main-campaign and "why IBM's are better than Ataris" (and vice-versa).

See my next post if you're interested in that latter comment in the least...

Sheesh! Calm down everyone! You're getting me excited!

4025. Thoughts on the PC X-Former and Darek

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-19 22:15:24 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940719151514.24002d33@sonoma.edu>
Source record: 99606

I met Darek Mihocka the other day (Sunday) and talked with him for quite a while and he seems to be a very cool guy. He seems to enjoy not only working for himself as Branch Always Software, but he even likes his other job at MicroSoft! :) (BTW- He told me there are actually QUITE a few MicroSoft employees who are Atari 8-bit fanatics! I wonder why they aren't on c.s.a.8 like he is?!)

Anyways.. from some of the comments I've gotten about the PC X-Former and its uses, it seems there are really less people who want the thing as more than a way to play M.U.L.E. and Star Raiders than I thought there were.

Unfortunately, these people seem to either not know or not care about all of the graphics, sound and hardware enhancements the Atari 8-bit has had in the past years (since the XE's came out actually, but that really has little to do with it I think).

If you say "ColrView/APACView" to someone who even knows what they are, I'd bet they'd say "Why even worry about it? If I wanna look at GIFs on my IBM, I'll use a GIF viewer for it!".

Well.. it seems nobody understands the potential in ColorView modes and APAC modes as more than just ways at looking at GIF's in more than four or 16 colors. Take for example "The Wall", or "BOMBit XL/XE" (when I get the damned thing to work).

I was talking to Darek about (what someone here mentioned long ago) the fact that ColorView and APAC modes were literally described in the old (circa 1982) Atari documents. The other night I was looking through _De_Re_Atari_ and found the section which explained the use of page-flipping and DLI's and VBI's to get more colors out of the machine. It even had a small hand-drawn figure which showed how you could get more luminence resolution out of some modes! It's amazing! Anyways, to my point, I thought to myself "this is about 6 years before its time!". APACView came out around 1988, correct? If ONLY Jeff Potter or someone had thought of APAC mode and ColorView modes YEARS EARLIER! WOW! Atari's advertisements could have claimed "4096 colors!" instead of the whopping 128. ("Whopping" here is actually not sarcasm. Look at old magazine reviews of computers. Atari had 128 colors. Commodore, 16. Apple 16. IBM at the time had like 4 or 16 or something as well.)

Anyways.. back to my point about the emulator. I went over with Darek how ColorView mode works and how Graphics 9 and Graphics 11 modes are effected by location 712 in memory and all that, so we'll hopefully have CV9 mode working on PC X-Former 3.0! :) I also gave him a few demos (mainly German ones) with which to test his little program on :) ...

Oops.. I'm digressing again I think. :) Anyways, whenever someone says that demos are useless, ColorView is only good for viewing GIFs if all you HAVE is a real Atari, not an IBM with 256 colors, etc., but turn around and say "all I want the PC X-Former for is to play games" you're sort of killing yourself by not making SURE Darek gets the emulator to "be all that it can be" - getting ColorView to work right. Getting European demos to work right, etc.

In the GAMING world, especially for Atari 8-bits, a lot of what we see are software tricks. Sure, some games are simple redefined character sets and player-missles. But others, the really tremendously SUPERB games are the things which are comprable in the tricks they use to the better European demos.

If all you want the PC X-Former to do is to emulate a little Atari 800 with some player missles and the old OS graphics modes, why don't you just go to a garage sale and pick up an Atari 800. At least you'll be able to play cartridge games!

If you want to be able to play things like MegaBlast, which makes the Atari CPU fly like a mach-3 jet, then you'd better not complain that "if I wanna look at GIFs, I'll use <IBM GIF viewer here>" or "if I wanna use a word processor, I'll use <IBM word processor here>, not AtariWriter+ or TextPro", because the newer games stretch the limits of the Atari. (And games like MegaBlast happen to run VERY NICELY when running on a 128k machine, not just a 48 or 64k machine) (And games like The Wall happen to need the more exact timing and ColorView style graphics mode support to run. Sure, it's just Tetris. We have that in Atartris I and II, Cooltris, Tetrix, Fortress, etc. but can any of those claim 64 colors available anywhere at any time and still fit in what, less than 10k?)

Anyways. PERSONALLY, I'm all FOR the PC X-Former. I'm ALSO (I feel like swearing at someone) ESPECIALLY all FOR the Mars8, the R:P:Connection, the BlackBox, the new SpartaDOSes, ScotchDUP for MyDOS, The Wall, Super Cornholio Bros., COM_Run (oh wait, I made that and it sucks <grin>), SIO2PC, etc.

There's my 2c (with pretty much no actual point other than to get my feelings out on what the PC X-Former should be capable of doing, INCLUDING RUNNING TEXTPRO THANK YOU VERY MUCH, and to try to let the people who "have both an Atari and an IBM, in one machine" know that they are DEFINITELY missing out by just running the VERY incomplete PC X-Former (aka XF2..))

4028. Just for fun: New Breed Software Atari XL/XE Software catalog

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-19 22:33:19 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940719153229.24002d33@sonoma.edu>
Source record: 99608

```
NEW BREED SOFTWARE ATARI 8-BIT TITLES!
June 1, 1994

Name: BOOM!

File: BOOM.ARC
Type: 1 player game.
Description:
Catch and extinguish the mad-bomber's bombs or get your buckets blown up!
Paddle or joystick control.
Requirements:
Atari BASIC
Joystick OR paddle

Name: CHICKEN

File: CHICKEN.ARC
Type: 1 player game.
Description:
You're the chiken, trying to run across the 6-line highway!? Avoid the
traffic and dodge falling rocks to beat each level. Get hit and out
comes the Humane Society's emergency van!
Requirements:
Atari BASIC
or TurboBASIC XL
Joystick

Name: COLORIZER 1.1

File: COLORIZ1.ARC
Type: Graphics utility.
Description:
Colorize Graphics 9 (80x192x16) grey scale images, APAC (80x96x256) color
images, and APAC-Interlaces ("Pryzm") (80x192x256) color images. Edits only
the color data.
Includes online help.
Requirements:
XL/XE

Name: COM_RUN 0.0

File: COM_RUN.ARC
Type: Command Line Interface.
Description:
This set of programs gives the user an MS-DOS or SpartaDOS style environment
through the use of command line operated programs in TurboBASIC XL. Handles
simple batch files as well.
```

Includes many demo files and external program.
Most external programs include online help.
Requirements:
XL/XE
TurboBASIC XL

Name: COOLTRIS

File: COOLTRIS.ARC
Type: 1/2 player game.
Description:
A "Tetris" clone with 1-,2-,3- and 4-peice shapes, non-rotatable shapes,
two types of 'bombs', a 'weight' peice, and a 'crystal' peice.
One- or two-players simultaneously.
Includes online help.
Requirements:
Joystick optional for one player,
required for two players.

Name: DIDI7 DEMO

File: DIDI7.ARC
Type: Audio Demo.
Description:
A very strange audio demo using samples from a DiDi-7 infomercial and
a clip from Ren and Stimpy!
Requirements:
XL/XE
TurboBASIC XL

Name: DIGI-PONG

File: DIGIPONG.ARC
Type: 2 player game.
Description:
Pong is back, but now with digitized backgrounds and digitized sounds!
Use Graphics 9 (80 x 192 x 16) grey scale images for backgrounds and
Parrot sound files for the sound effects!
Requirements:
XL/XE
Sound recording/editing optional

Name: DOLLMAN

File: DOLLMAN.ARC
Type: Audio Demo.
Description:
An audio demo of a song from the movie 'Dollman'.
Requirements:
XL/XE
TurboBASIC XL

Name: DR.ATARI

File: Not Released
Type: 1 player game.
Description:
A 'Dr.Mario' clone. Move the two-colored pills in the jar and line them up
to match 4 colors in a row. Get rid of the virii in the jar by making them
part of your color-matches.
Requirements:
XL/XE
Joystick optional.

Name: ELEVATOR

File: ELEV.ARC
Type: 1 player game.
Description:
Run back and forth across the elevator shafts in a highrise without being
hit by the crazy elevator people. A clone of an old IBM PC game.
Requirements:
Atari BASIC
Joystick

Name: EQUATION

File: EQUATION.ARC
Type: Utility.
Description:
This simple program takes an infix notation equation (like "2+2*3"),
parenthesizes it according to 'order of operations' ("(2+(2*3))"), changes
it into reverse-polish notation ("2 2 3 * +") and calculates it! ("8").
Very simple. Can be easily made into a COM_RUN external!
Requirements:
TurboBASIC XL

Name: FLUSHER

File: FLUSHER.TBS
Type: Graphics utility.
Description:
A simple optical graphics demo that takes a Graphics 9 (80 x 192 x 16) grey
scale image and 'twists' the image around the center of the screen.
Requirements:
XL/XE
TurboBASIC XL

Name: FLY

File: FLY.ARC
Type: Video Demo.
Description:
A fullscreen visual demo (in 160 x 192 x 4 mode) of a girl on a bird-lizard
from the movie 'Heavy Metal'.
Requirements:
XL/XE
192k highspeed drive space

(ex: 256k and RAMdisk installed)
TurboBASIC XL

Name: GR9->ASCII

File: GR9ASCII.TBS
Type: Graphics utility.
Description:
This program converts a Graphics 9 (80 x 192 x 16) grey scale image or an
APAC-Interlaced (Pryzm) (80 x 192 x 256) color image into a 40- or 80-column
text file in either normal (for bright-on-dark viewing) or reversed (for
dark-on-bright viewing or printing).
Requirements:
XL/XE
TurboBASIC XL

Name: HAPPY MONDAYS DEMO

File: HPYMNDYS.ARC
Type: Audio Demo
Description:
An audio demo made from clips from a Happy Mondays song.
Requirements:
XL/XE
TurboBASIC XL

Name: HOPPER

File: HOPPER.ARC
Type: 1 player game.
Description:
Hop around on the disintigrating platforms gathering golden bags of
money while avoiding the red block-head and trying not to fall off
of the screen! A simple old Atari BASIC game.
Requirements:
Atari BASIC
Joystick

Name: JAMES BROWN DEMOS 1-3

File: JBROWN.ARC
Type: Audio Demos.
Description:
Three audio demos of James Brown song clips.
Requirements:
XL/XE
TurboBASIC XL

Name: KNIVES AND FORKS DEMO

File: KNVSFRKS.ARC
Type: Audio Demo.
Description:

An audio demo of Information Society's "Knives and Forks" song.
Requirements:
XL/XE
TurboBASIC XL

Name: K-OS 0.0

File: Not Released
Type: Operating Environment routines.
Description:
A windowing, pointer-controlled, task-swapping, text-based environment
written in Action! which makes the use of RAMdisks or Harddrives for
'virtual memory'.
Requirements:
Action! language optional.

Name: LANDER

File: BASLANDR.ARC
Type: 1 player game.
Description:
Maneuver your lunar lander over the rocky surface and try to land without
flying out of orbit or crashing into the rocks.
Requirements:
Atari BASIC
Joystick

Name: MINARETS SOUND DEMO

File: MINARETS.ARC
Type: Audio Demo.
Description:
A one minute digitized recording of the song 'Minarets in Memory'.
Requirements:
XL/XE
192k highspeed drive space
(ex: 256k and RAMdisk installed)
TurboBASIC XL

Name: MINARETS "SPIN"

File: SPIN.ARC
Type: Video Demo.
Description:
A partialscreen visual demo (in 160 x 192 x 4 mode) of a person holding a
crystal ball and spinning around from the video for 'Minarets in Memory'.
Requirements:
XL/XE
TurboBASIC XL

Name: MYBBS 0.0

File: Not Released
Type: Bulletin Board System.
Description:
This simple BBS includes a text editor, 'door' program spawning (with a voting door, a maze game door, and a users' quotes door included), user lister, bulletins, info-files, online BBS-user help all over, and can fit on 1 or 2 drives! Most everything except file transfers and networking (which MAY be written and released soon as doors!)
Requirements:
Modem.
MyDOS.
Action! language optional.

Name: PLATFORM

File: PLATFORM.ARC
Type: 1 player game.
Description:
Jump up onto the moving platforms without missing them to get to the door at the top of the screen. A clone of one of the mini-games in the old Atari 2600 "SwordQuest: Earthworld" game.
Requirements:
Atari BASIC

Name: PUZZLE

File: PUZZLE.ARC
Type: 1 player game.
Description:
The famous 15-tile sliding puzzle game. Try to get the numbers in order by sliding them one at a time into the open space.
Includes load/save/print options.
Requirements:
Atari BASIC
Joystick
Printer optional.

Name: RED

File: RED.ARC
Type: 1 player game.
Description:
Fly over the drought-ridden land of magical springs past Meanies, volcanoes, birds and through caverns in this side-scrolling 11-level Atari BASIC arcade-style game.
Requirements:
Atari BASIC
or TurboBASIC XL
Joystick

Name: ROCKS

File: ROCKSBAS.ARC
Type: 1 player game.

Description:
A simple 3D asteroids clone for Atari BASIC.
Requirements:
Atari BASIC
Joystick

Name: RODENT REVENGE

File: RODENT.ARC
Type: 1 player game.
Description:
A 'Rodent's Revenge' (for Windows(tm)) clone. Move the blocks around to
capture the cats and avoid the traps, pits and attacking yarn balls.
Includes online help.
Requirements:
XL/XE
Joystick optional.

Name: SCOTCHDOS

File: Not Released
Type: Command Line Interface.
Description:
An MS-DOS or Sparta-DOS lookalike for MyDOS which handles batch files,
command line commands, variable and strings!
Requirements:
MyDOS.
Action! language optional.

Name: SIMON

File: SIMON.ARC
Type: 1 player game.
Description:
The old electronic game of 'Simon Says'. Copy the computers button
selections exactly or you lose. Variable speed.
Requirements:
Atari BASIC

Name: SLUDGE

File: SLUDGE.ARC
Type: 1 player game.
Description:
A 'Pipe Dreams' clone. Place the pipe peices on the screen and connect them
to get the sludge to flow far enough not to spill and to slow down.
Includes online help.
Requirements:
Joystick optional.

Name: SKYDIVER

File: SKYDIVER.ARC
Type: 1 player game.
Description:
A clone of the old Atari 2600 'Sky Diving' game. Jump out of the plane,
remember to pull your cord, and try to land on the tiny target while being
blown around by the wind.
Requirements:
Atari BASIC
Joystick

Name: STIMPY DEMO

File: STIMPY.ARC
Type: Audio Demo.
Description:
A strange audio demo with clips from the "Ren and Stimpy" cartoon.
Requirements:
XL/XE
TurboBASIC XL

Name: T-1000

File: T1000.ARC
Type: Video Demo.
Description:
A partialscreen visual demo (in 80 x 192 x 16 mode) of the T-1000 from
"Terminator 2" morphing and pouring into a helicopter.
Requirements:
XL/XE

Name: USURP

File: USURP.ARC
Type: 2 player game.
Description:
A tic-tac-toe/checkers style game in 3 dimensions: 4 x 4 x 4. Move your
peices around the boards and try to 'usurp' the other player's peices
(by landing on them).
Includes online help.
Requirements:
Atari BASIC
Joystick (2nd optional)

Name: VEGAS

File: VEGASBAS.ARC
Type: 1-player and 1-4 player games.
Description:
Two games:
Jackpot - a one player slot machine demo game.
BlackJack 21 - a one-to-four player BlackJack game. Add players
during a game, joystick (buggy) or keyboard control.
Includes online help.
Requirements:

Atari BASIC
XL/XE may be required
(for BJ21)

There are 2 programs which would be best bought and source code provided for enhancement. Paperclip XE, and Syncalc. If these were attained with commented source code then somebody could go in and do a housecleaning of the banked ram and disk routines so that we'd have a 4 megabyte LINEAR transparently banking word processor and a 4 megabyte compatible Spreadsheet both compatible with hard drives.

If I had those 2 programs with said enhancements I would be a very very happy 8-bitter. 1.79mhz or no, that is a LOT of freedom to work in.

Re: early hints at Apac/CV.

No, let's face it. CV and Apac are cool, but they ARE crutches. If Atari wanted to do it right they could have added better graphics modes in the XLs.

You see, in an 16K machine, keeping screen memory no large than 8K was important. But in a 64K machine, a 16K screen memory mode would not have been too much. In a 138K a 64K graphics mode that used all the banks for ANTIC access would have been ideal. It would have been possibly to add better 320x192 modes. 16 color 320x192 from 128 palette would have been possible probably. A full 128 color 160x192 mode would have been possible. But they never went into it and by 1985 the days of enhancing the Atari 8-bit was over. The ST came along and as we know Atari didn't really enhance the ST much either (at least as far as offering newer faster CPUs and resolutions).

I don't see CV and APAC so much as an asset of the Atari but a convenient crutch for it's limitations.

The same way I feel about the lack of a hardware 80 collumn mode. What Clay does with FlickerTerm probably could have been done as a real mode. Just like you can invoke GTIA for 2-bit 16-shade fonts, why not a hardware 80x24 text mode where 8-bits are reduced to 4-bits? Then FlickerTerm would not flicker. The adjoining characters would bleed more, but still. I can't comment on the feasibility of 640x200 aside from the fact that I know the 1.79mhz timing does present a limitation. Only upping Antic to the full colorburst frequency would allow for 640x200 probably. I believe (and don't quote me) that the 7800's Maria chip runs at twice the 1.79mhz system clock and thus providing more flexibility and color in 320x200. And tha is 1984 technology. And we all know the C=128 got hardware internal 80 collumns.

4035. Nebie/Emulator FAQ (and on c.s.a.8 my catalog) ^M

Instead of ASCII uploading the Atari 8bit Newbie / Emulator FAQ to the system's editor, I instead did a Zmodem upload to my account. Unfortunately, I forgot about the stupid ASCII vs. whatever-this-VAX-uses (where [Control][M]s are redundant- only ONE character is needed for an end-of-line, like on the Atari) and when I posted the messages, every line was followed by a "^M".

I will repost again later today (the Newbie/Emulator file - if anyone wants a New Breed Software catalog, just e-mail me and I'll see about sending THAT properly as well <grin>).

Also, I received mail from the moderator of comp.emulators.annouce and was told I should also cross-post the Newbie/Emulator FAQ to that newsgroup as well, so, I will! :)

If you don't already know, rz and sz have an "-a" switch for converting
ASCII files to Unix and vice-versa during the transfer.

At least on my system it does.

ASCII is ^M^J. ^J = linefeed, or in unix (or Amiga) it's called newline
and that's all you need. I do like the elegance of just one character
for a return as the Atari 8-bit, Unix, and Amiga has it. ^M^J is really
just a holdover from typewriters.

OmniCom is a good 80column software with both Vt100 and Atascii emulation
in 80 column mode. It has a capturing feature and Xmodem (but I haven't
seen transfers work very well). It is difficult to set up but it works
great. You need extra R: handlers for it also.

>
> Is this an Atari 8-bit newsgroup or an Anti PC newsgroup? Hmmmm, sad....

You don't understand. Most of the people here don't see any reason to
buy the "state of the art", when the old technology fills their needs
(and budget!) just fine. That's no reason to flame them.
Others have upgraded due to increased needs, but still have enough
interest in and knowledge about the old machines to participate here.

I used my 1200xl almost exclusively, until a year or 2 ago when I
finally had to move up. I now use Unix workstations at school & work,
Macs at school, and DOS/Windows machines at home and work, but I still
have the 1200XL set up on my desk at home, and most of my computer
books are still about the Atari.

If these are the kind of posts we're going to get due to the emulator,
then I'll have reverse my previous position and say GET THESE POSTS
OUT OF HERE!

Off the top of my head (I'm not at home now):
BASIC command summary
useful memory locations (mostly graphics)
6502 opcodes
joystick codes
color values (for setcolor)
graphics mode summary (very thorough)
ATASCII chart (it'll be hard to put all of this in ASCII)
keycodes
error codes

and more!

I might get time to type it this weekend (we've all heard that before,
right?), but if anyone else has it, don't hesitate to get a headstart.

The Mac also does this, but instead of using a linefeed character a.k.a.:
^J, the Mac uses the carriage return, a.k.a.: ^M. This probably adds
nothing to the discussion, but I figured I'd just throw in my two bits. :)

4047. Help: Using dskcom32 with sio2pc

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-20 08:32:16 UTC
From: kevina@clark.net
Message-ID: <30ineg$3pf@explorer.clark.net>
Source record: 99626

Hi, I just got my sio2pc interface today but when I tried to use dskcom to create an Atari DOS 2.5 disk immage it kept on giving me Error 139 (Device NAK) It created a disk fine on my 1050 drive but I could not get it to work with a disk immage under either DOS 2.5 OR SpartaDOS 3.2g. I tried creating a 92K disk immage at single density 92K disk immage at Double density, I even tried formatting the first in DOS 2.5 with no luck. Could someone tell me what is going on here.

PS: I created a 16,776,960 HD immage using sio2pc and used HD Init to format it and it worked just fine.

BAHAHAHAHAHAHAH!

I've had that problem as well!

Some supposed fixes for it are:

1) make disk image
2) format it
3) save it
4) uninstall it
5) install it with the /p (physical access) switch
6) try DiskComm on it

One that seems to work a lot for me is:

1) be sure the DOS understands the density of D1: with your 1050
(try [O] in MyDOS)
2) turn off your 1050 and make a disk image as D1: (DON'T do [O] again!)
3) format it (sometimes formatting a disk on the 1050 between 1) & 2) helps)
4) run DiskComm

What I think it is, at least with MyDOS, is it doesn't totally understand
that the SIO2PC disk image is such&such a density. >:^(

I've said it before, and I'll say it again! We need a "DCM->ATR" program.
ESPECIALLY with the new PC X-Former hanging about.

Oh, finally.. try writing the disk to the 1050, then turn off the 1050 like
above, and write the disk to the same drive, but via SIO2PC. THis almost
ALWAYS works.. but takes over 2x as long as it would if you could just
get the thing to work the 1st time! :)

>get the thing to work the 1st time! :)

That just gave me an idea. Why not have Sio2PC emmulate entire Disk
Drives as Long as Just Disk Immages. If it immulate a disk drive there
would not be any of tge problems above. The Drive Immage will start up
taking no space and upon reciving a format command it will create a disk
image inside the drive and format it correctly with out any problems. If
you expand this idea you can even have a command to inset and remove
disks and even a command to flip the disks if its a flippy. You could
even slow it down to the speed of the drive for those programs that check
it (for copyprotection and such).

Of course you can still use normal disk immages for HD like drives and such.

SO what do you think of that idea.

I can never get a connection to atari.archive.umich.edu. Is there another site where I can get SIO2PC?

Thanks.....

4053. Atari Newbie / Emulator FAQ. One forgotten answer and then a survey.

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-20 20:35:36 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940720133530.240034ec@sonoma.edu>
Source record: 99631

I now label myself a numbskull. I wrote a TEN PAGE FAQ and forgot one of the most IMPORTANT questions and answers: WHERE DO YOU GET THE PC X-FORMER!?

Well.. for us Internetters, there's this (and probably others) FTP site:

ftp.clark.net directory: systems/msdos/emulators file: xf2.zip
login: anonymous pass: <your address>

Now, on to my little simple survey. In the beginning, the "XF2FAQ.TXT" file I have sitting on my hard drive was pretty much that, an FAQ file about the PC X-Former (and it would include any other Atari 8-bit emulators that come out in my lifetime <grin>). It had simple answers to a few dozen crazy Atari 8-bit questions (hence the "Newbie / Stupid Questions" in the title) but in the two revisions that have occured (0.1 and 0.2), a much GREATER percentage of the thing has nothing to do with the emulator. The reason the information is in there though is the questions are more directed to new Atari 8-bit users. With the release of the PC X-Former 2.0 (and coming up the 3.0), there's going to be many more new users than we've probably ever seen.

ANYWAYS, Michael Current, "Keeper of the 8-bit Atari FAQ [etc]" dropped me a note via E-mail suggesting that I should split the file into two. One part would be everything you never wanted me to tell you about the PC X-Former, getting files to your IBM, etc., and the other part would be all the silly crap I have in my "Newbie/SQ/Emulator" FAQ that doesn't have anything to do with the emulator itself. I'd then post the Emulator part of the FAQ to comp.emulators.misc, and the other part to comp.sys.atari.8bit.

Well.. When I first posted the FAQ, I did that, sort of. I posted the WHOLE thing (which was about half and half: emulator/Atari) to BOTH newsgroups, but then got some comments like: "GREAT FAQ! Just don't crosspost it to c.s.a.8!" <grin> And that I did. Now that the thing is about 1/4th or less emulator-based information and the rest is all Atari stuff, it seems to be getting called back <HEY! COME BACK!> to the c.s.a.8 group. <grin>

WHAT SHOULD I DO!? That's my question. I have a few ideas brewing:

1) Do what I've been doing. Stick the whole thing in comp.emulators.misc and put a note in comp.sys.atari.8bit about it every time it's reposted.
2) Crosspost it to both groups as the one big file it is.
3) Split it into two like Michael suggested. Post the emulator and IBM-based questions on comp.emulators.misc, and the rest of the stuff on c.s.a.8.
4) Split it into two and let Michael grab all of the general stuff and edit it up and let him stick it into the "8bit Atari" FAQ, and change the name of my FAQ from "Newbie/Stupid Questions/Emulators" to just "Emulators".

So.. PLEASE follow-up (post) or E-mail me as to what YOU folks think I should do, pretty please!?

Thanx very much!

I'd like to see the emulator stuff stay. I own about a dozen classic 8-bit machines and use them for logging in to work from home, plotting the temperature and ferment rate of my homebrew beer, translating IR remote codes between my various appliances, timing cars on my slot-car race track, and of course for some game-playing. They are great machines and I enjoy developing programs on them. However, I do most of my development on a Unix workstation and have to download the code to the 8-bit to complete the edit-compile-run cycle. When (if) the X windows emulator is released, that'll be so much less painful...

The point is, the emulators can only increase the interest in the old classics, and, I wager, will increase dramatically the amount of software produced for them.

Source record: 99599

Hy Glenn M. Saunders,
about the BW-DOS here are some small infos from the manual. The DOS will be available when I sent it to my friend and he did uucode it to the server.
BW-DOS uses disk format compatible with Sparta DOS.
This means that it is possible to use BW-DOS in full (including booting). Most of CIO commands and other features are compatibletoo, lo lots fo programs written for SDOSwill work..
Any disk with capacity up to 16 Mb is possible...
single file may be up to 8 Mb long.
BW_dos does not use the RAM under OS-ROM, so it is compatible with softwaer wich usethis memory,
such as popular Turbo Basic, and others.
The MEMLO value is $1ef9 (in V 1.0).
In addition xeveral small bugs known from Sparta DOS are not in BW-DOS, especially problems with
XF 551.

I am looking for the 1200 baud modem produced by Atari Corp,
the model number was SX212. It had both an RS232 port, and a funny
looking SIO port on the back.
Please email me if you have one you wish to sell for a reasonable price.

Thank you.

]We don't need infighting in the 8-bit group itself.

I'll second that. I find it truly disturbing that a community as small
and fragile as ours devotes so much effort to alienating its members. I
can't imagine why someone reading this group for the first time because
of an interest in resurrecting the old 8-bit in his closet would want to
stick around. What does it take to get people to cut each other a
little more slack? If you really just HAVE to fire up that flamethrower
to make sure it's still in working order, do it in e-mail.

From: lordthan@news.delphi.com
Message-ID: <30kmd7$5i1@news.delphi.com>
Source record: 99638

First, thanks to Jeff_M_Lodoen@cup.portal.com,
gtkakega@FLASH.LakeheadU.CA, ScottM@cup.portal.com, and
bruck@brachot.jct.ac.il for providing me with ~150 addresses. Letters
w/distribution agreements will be mailed out this Friday.

Second, thanks to bruck@brachot.jct.ac.il for forwarding Ben Poehland's
well written message. I had missed the original posting. In response to
Ben's letter, I have a comment or three.

Ben says "Whoever does the mailings must be prepared to expend the
following resources" and lists the following:

1.) All your free time for one full year.
-----My free time these days is expended towards working on my lawn,
keeping the house clean, working out at the gym, and playing Sega. In
short, my free time is expendable if the cause is (IMO) worthy.

2.) $500 of your own money.
I'm assuming that this money is for stamps, etc. If so, that's a little
high. I figure the cost will be much smaller. I have a laser printer and,
thus, a means to bulk produce the letters and agreements. Envelopes are
cheap. The ~150 letters I have already prepared will cost ~$45 to mail;
that's okay, I've got it covered. Uploading the resulting programs (if
any come to bear) is no problem; Rutgers is local, and a friend has
already agreed to upload the files for me. The only other major cost I
can forsee is telephoneing (if necessary) the companies, which may indeed
run several hundred dollars. To that I say, hey, I'm willing.

3.) Computer resources to keep track of contacts, responses, & followups.
Already got that, and I've written a small HyperCard program to keep
track of those variables and others.

4.) Expenditures for competent legal advice.
Getting the contract written didn't cost as much as I thought, and the
cost went down 'cause I'm bartering some typesetting skills (redesigning
letterhead, business cards, etc) with the law firm.

5.) Grossly excessive wear & tear on your nervous system.
Hey, I'm on the internet. My nervous system is already shot. :)

"I STRONGLY disagree, the EMULATOR IS THE ENTIRE FUTURE OF
THE ATARI 8-BIT PERIOD!"

Let me take this opportunity make a challenge (not just to you, but all). Point out any new development (software or hardware) for an emulated machine that resulted from the development of an emulator.

Another item. Amigas and ST's both have had a variety of PC emulators. Where where these usually discussed; in PC groups and SIGs or in those for the Amiga and ST? Yet, when it comes to emulators of 8-bit machines (C64, TI-99/4A, and Atari 8-bits) running on PC's, these get discussed not in the group or SIG of the machine running the emulation (although it is a software application for that machine) but in the groups and SIGs for the emulated machine. If this sounds like a double standard, it is because it is. It boils down to this: the emulator gets discussed in the group or SIG of the less popular machine (the emulated or the emulator).

In a message dated 7-13-94, Vladimir Elberg said:

"anyone using an 8-bit in 1994 is either in a time warp or
is an antique collector."

It would appear that you are implying one does not have the right
to collect antiques. You're right...I'll go out right away and
start campaigning for all the people with '66 Mustangs, '57 Chevies,
etc. to drive those old cars to the junk yard and go buy something
new and "state of the art". <grin>

"Some of us with "STATE OF THE ART" machines like to go
back and relive the 8-bit days,"

How nice that all of us living in a time warp have been around then to
keep this newsgroup "warm" for nostalgic emulator users. <grin>

"dont like it, go somewhere else, it all belongs here."

This is an opinion, not fact. Here's is a fact: PC Xformer is
software which runs on a PC, which makes it a PC application. Logically,
one should be able to discuss it in a PC software newsgroup. However,
if you tried it, you would likely find the reception you have recieved
here inviting by comparison. Further, try your reply above to any
anti-emulator posts you might recieve there, and you would likely
have an overflow of nasty e-mails.

Let's face facts: People don't post PC Xformer talk in c.s.a.8 because
it is the "right" place; they post it here because it is the easiest
place (i.e., access vs. negative feedback).

Okay! How about this?
I read a book quite a few years ago (Soul of the Machine) (??)
about how a computer named "Eagle" (I believe) was designed
and _emulated_ on a larger computer. Since my memory is
not all that great on details like this, I will *guess*
here that the company was DEC. The "Eagle" was then
produced and sold at computer stores near you.

So does the introduction of _new_ hardware as a result
of *total* emulation count? And look at all the software
that had to run on that machine after it was produced.
Does that count as _new_ software?

Just nit picking here of course.
Someone more versed in computer lore will correct
any errors I may have produced in this post. Hopefully.

It gets through reading the control.dat and also through most of the
message indexing I think before it cuts out. I thought maybe I shoud hve
run messages.dat through sb with the -a switch to convert it to ASCII
from the newline but I think uqwk outs it with CR/LF to begin with.
Actually it seems as though message lines are separated by inverse little
cs which are some goofy ASCII value.

If I can find out what those error codes mean then maybe I can figure out
if it's a hardware problem or something else.

: then I'll have reverse my previous position and say GET THESE POSTS
: OUT OF HERE!

First of all, I am not flaming anyone, but kind of pissed off at the way some people come across. I am an Atari 8-bit user and I am pissed to see that anyone who has a machine other than an 8-bit atari that is running an emulator is treated as an outsider and is not considered by some a "Real" atarian since I do not own my old Atari hardware anymore. Maybe its the Internet that make people so ignorant, I dont know, but one thing is for sure for some people on this usenet group, people who have a software emulator are not as good and should not be treated the same as the ones who have the hardware and this is pure bullshit.

Some of us are using the emulator to use the 8-bit again, I have three *.ARC files full of games, from pacman to defender to Caverns of Mars and I am enjoying them bigtime..... I have over a Megabyte and a half of games in ARC format and could upload them to a site, but alas (p) stuff, but the commodore 64 emulator has plenty.

> Does that count as _new_ software?

If I remember correctly from the operating system documentation, most of
the original Atari operating sd=ystem development was done and debugged on
a DEC, which means the DEC was emulating the Atari at least during
debugging phase.

But then perhaps they just used the DEC to download the code to some
breadboarded hardware.

Anything you create, such as a software package, is automatically copyrighted the moment it is created. You, as author, own the copyright. Formally registering an official copyright with the us copyright office is not necessary, but it makes an official notice of the copyright so that if you go to court over a copyright dispute, it will strengthen your case as you will have to prove who developed and created the work and when. With an officially registered copyright, its certainly very easy to show you are the copyright owner, without it, it's more difficult. This, of course, only applies here in the us. Outside of the us, I don't know what the copyright rules are.

We are dismantling a CAI (computer assisted instruction) system and have many Atari 1040ST's. These are machines with no hard drive and a single 3 1/2" floppy drive the only software supplied was a boot diskette to connect these to a minicomputer via data lines. We would like to use these now to teach elementary word processing in lower grades. Does anyone have information on where to find operating system disks that will enable us to boot up in the standalone mode? Also, we need information as to what word processing software we can run on these. Any help or information will be greatly appreciated.

Chances are the write protect sensor is bad, it is fairly common. Mine went bad about a year ago when I decided to buy another Atari, it was sitting in a closet for a long time. My problem was that the LED went bad, and of course I couldn't find a LED of the same size, and intensity, and same color, so I decided to clip the wires and solder together the wires that went to the light sensitive diode (forgot what they are called -- sheesh) and that fixed the problem, only problem is that you have to be EXTRA careful, it will write over disks with or without write protection. This usually reports a error when trying to write, and usually it is write protect error. If this is not the problem then there is a chance that the head could be bad or some other component. I am not sure how the US Doubler works, but if it has two read/write heads then you might want to see if data is written or allocated at all on either side, if it does on one but not on the other then you at least know which head and mechanisms have the problem. I can't really offer much more help.

4083. For Sale: Classic Printer for Classic 8-Bits

Newsgroup: comp.sys.atari.8bit

I have the classic Star SG-10 printer for sale. This was *the* printer to own if you had an Atari Classic back in the 80's. Can print many different graphics formats as well (ATASCII, images, paint files, etc.). It comes with a Digital Devices cable/converter so you can plug it in directly to your computer. No 850 or PR: device is necessary. I'll also include some paper, a dust cover, and a desktop printer stand. This will work with any Atari 8-bit.

All this can be yours for just $60 ppd.

4088. Atari System for sale - lotsa games :)

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-21 23:44:29 UTC
From: jmfuchs@unix.amherst.edu
Message-ID: <30n18t$pog@amhux3.amherst.edu>
Source record: 99568

Hi. I'm moving out to Colorado in a few weeks, so I want to unload my Atari 800 XL & trappings before I leave. This is to be sold as a package - I'm not selling any of the games or whatever separately.

What I have:

Atari 800XL - Everything about it is in good condition, except one thing - the left joystick port somehow broke off. This is a pretty easy job to fix, I'm sure, but A. I'm a complete klutz, B. I don't own a sottering iron, and C. I'm lazy.

Disk Drive - In perfect working order. Jesus, I forgot the name of the company, but it's a good one - lots of little red lights and stuff. When I go home, I'll check it and repost.

Games:
(+ means comes with docs, 0 means no docs but the game is so simple it doesn't matter [worst comes to worst, e-mail me and I'll tell you anything you need to know,] - means no docs and you probably need them.)

Star Fleet I +
Donkey Kong o
Vanguard o
Ms. Pac Man o
Pole Position o
Alternate Reality - The City (w/ hint book!) +
Alternate Reality - The Dungeon - (command card + map, though)
Archon o
Archon II - Adept +
M.U.L.E. + (best multi-player computer game _ever_)
Telengard +
Temple of Apshai +
Sneakers o
Racing Destruction Set +
Raid over Moscow +
Trailblazer o
Ultima III +
Ultima II +
Ultima IV (no map, but hint book)
Catle Wolfenstein -
Bruce Lee o
Lode Runner 0 (Includes a bunch of levels I made when I was 10!)

Imagic 1-2-3 o (3 simple action games - 2 fun, one dumb, as I
recall.)
Spy v. Spy +
Gemstone Warrior -
Conan o
Super Boulder Dash +
Realm of Impossibility o
Ogre +
Age of Adventure -
Karateka o (Primeval Prince of Persia)
Cyclod o (sort of like Pengo)
Action Biker +
Phobos o
Crossfire o
Claim Jumper o
Embargo o
Star Raiders -
Robotron o
Autoduel +
Hacker o
F-15 Strike Eagle (commands written out)
Mail Order Monsters +
Wizard's Crown +
Murder on the Zinderneuf +
Beach-Head +
Beach-Head II o (great 2-player game)

Other stuff:
DOS 3
Some copying program
Owner's Guide and DOS reference manual
Dr. Wacko's Guide to Making Arcade Games (comes w/disk)
2 good ol' fashioned Atari joysticks
All the wires and stuff.

Price: I'd like to get $250, including shipping costs. I'm pricing the computer @ $30, the disk drive @ $60, and the games at about $3 each. (Joysticks, DOS, Wacko, etc. is free.) Admittedly, you get some losers, but you also get M.U.L.E., the Ultimas, Mail Order Monsters, the Archons, etc., for $3 each, so I figure it evens out. Send any inquiries to jmfuchs@unix.amherst.edu.

Thanks,
jesse

4090. Author Policies: New AC vs CN

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-22 01:15:40 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407220115.AA042239710@relay2.geis.com>
Source record: 99569

NOTE: this post was sent to the Newsgroup on July 18 but never appeared in the Digest, so I'm re-sending it. Two other posts I sent at the same time just vanished. Sheesh.

Author Policies: "New" Atari Classics vs. Current Notes
(Also, Update On Refunds & Developments With The New AC)

Referring to Jeff Potter's recent post ("Andy Floyd's CSYA and Atari Classics"), I'd like to offer some updated information & clarification.

Jeff indicated that in the event Andy's unpublished manuscript was forwarded to either CN or the new AC, he didn't believe either publication would offer author stipends. The Staff of AC was disbanded in May, so Jeff has not been privy to the behind-the-scenes efforts & negotiations involving the shutdown of AC & the startup of the revived publication, which have been handled privately by me.

Policy at Current Notes is set entirely by its Publisher, Joe Waters. CN's 8-Bit Editor, Rick Reaser, has little or no say in matters pertaining to author compensation. Presently CN's policy is to reward contributing authors with a single-issue extension of their subscription, plus I think a gratis copy. I'm not aware of any changes in that policy. I doubt if it has been liberalized, as CN (like most Atari magazines), has been on the decline in recent years.

AC's policy was to reward authors of minor articles (usually "advocacy"-type pieces) with a 1- or 2-issue extension of their subscription plus a gratis copy. Authors of major feature articles were rewarded with a $25 cash stipend plus a gratis copy. Editors on the AC Staff were required to submit 2 articles per year & also subscribe to the magazine in order to maintain their Editor status. Editors were not compensated on a per-article basis like authors but were paid a flat fee of $200 per year which covered the value of their contributions plus their out-of-pocket expenses for phone calls, e-mail, postage, disks, etc. Editors also received 5 discretionary copies of each issue, mainly used for promotional purposes.

I've submitted a copy of AC's Publication Manifest to Jim Hood, the future Publisher/Managing Editor of the new AC, so he has a fair idea of how AC operated in the past. In direct communications with him I've secured his commitment to maintain the author policies that stood AC in good stead so well during my tenure. The probability is therefore extremely high that future submissions to the new AC *WILL* be compensated via subscription extensions, gratis copies, & cash stipends as described above.

My link to the SLCC people has been through Bob Woolley, who was a member of the old AC Staff. Bob has been in town the past week on business (in fact

is staying at a hotel only a few miles down the road from me). His work schedule is horrible, but he stopped by my place for a few hours last week & we did make arrangements for transferring the stock of back issues to California in the near future. I'm hoping to see him one more time before he leaves later this week, so we can discuss plans & ideas for the future of AC over dinner.

At their end, Jim Hood has secured publishing & printing facilites that will permit them to produce AC far more cheaply than Unicorn did it. This is an absolute necessity, since the way things are shaping up the new AC may have only half the number of subscribers the old one did. Their next step will be to negotiate transfer of the 2nd Class Mailing Permit presently held by Unicorn. They've not yet begun to assemble a staff, solicit articles, or commence promotional activities. Bob indicated (rather weakly) they were still hopeful of launching a July issue, but that's wishful thinking. They'll be doing well to launch in August.

In comparing notes with Bob, it appears there's a strong correlation between the number of subscription orders received by the new AC & the number of refunds issued by the old AC. Apparently a significant percentage of former AC subscribers are delaying subscribing to the new publication until they've got their refund in hand. This has hobbled planning for the new AC. The mail I've received in response to the refunds thus far consists mainly of expressions of amazement that people really did get their money back, which tells me most people did not believe the refund policy described in my editorial in the April issue. This has caught me somewhat off-guard, but given the many rip-offs & bad experiences with Antic, ANALOG, & AIM I can certainly sympathize with the general skepticism.

The real culprit here is Unicorn, who are taking their darn sweet time doing things. They agreed to have the refunds completed by August 1, but so far only 132 have been issued. We have 220 more to go & only a few weeks remaining. Since June I've contacted them numerous times to "encourage" them to speed things up. (Those of you who know me personally have some idea of what it means when I feel compelled to lean on people, especially the 4th, 5th, or 6th time. The grumpy Alchemist is an angel by comparison. And anyone who ever subscribed to AIM has an inkling of the agony of frustration I am enduring.) I spoke with Bill Rayl personally last week & obtained his assurance of Unicorn's commitment to complete the process by the agreed-upon date.

I'm just as busy now as I ever was during AC's publishing days, fighting the rear-guard action against Unicorn in behalf of AC's unrefunded subscribers while simultaneously providing a conduit of support for the fledgeling operation now underway in California. AC maintained a clean record of integrity & fairness unmatched by any other magazine, & by thunder I *WILL* pass that legacy intact to Jim Hood, come Hell or high water.

- Ben Poehland

Hmmmm, which version of PQ are you using, that sounds like a problem that was in the last Beta version prior to final release. To test this, get rid of your taglines.sdx or what ever file. If it works w/o taglines, then you have the older version that requires 255+ taglines just to work. Any less and you get and error 166.

> What is the value of a Bounty Bob Strikes Back cartridge
> (without box, manual, etc)?

Well, I bought one several weeks ago for $17. It's worth
what you're willing to pay.

> Any more than, say, Pac-Man or Star Raiders?

Definitely, those are very common and have been heavily
copied. "Bounty Bob" was apparently never pirated.

> I'm asking since a few months ago there seemed to be a
> rash of conversation about the game.

I'd just add that it is a nice piece of work. The new levels
are very challenging. And new objects as well.

The changes are subtle. Controlling transporters doesn't
require using the keyboard. You have finer control of jumps.
Lots more mutants. And if you die, you don't start over.

Sheesh! Where the heck were you a while back when
everyone was wanting to know just where Bounty Bob
Strikes Back could be found?

Where did you buy it? A dealer? A friend?

Yes, the new 3.2G will support partitions upto 16 meg. However, 3.2g does
not run under PCXF...to use a large partition under the current version
of PCXF you need to use MyDOS 4.5 which also support partitions up to
16 meg.

Memory tells me that error 181 in MyDOS is some binary load problem..

The MyDOS docs tell me this about the error codes:...

3 last byte of file read, next read will return EOF (MyDOS)
128 Break Abort (OS ROMs)
129 IOCB alread open (OS ROMs)
130 No such device defined in the system (OS ROMs)
131 Write-only IOCB, cannot read (OS ROMs)
132 Invalid command (OS ROMs)
133 Device or file not open (OS ROMs)
134 Invalid IOCB reference (OS ROMs)
135 Read-only IOCB, cannot write (OS ROMs)
136 Attempt to read past end of file (MYDOS) (really? MyDOS? hmm..)
137 Truncated record (OS ROMs) (hmm again)
138 Device Timeout (OS ROMs)
139 Device NAK (serial bus failure, OS ROMs)
141 Cursor out of range for graphics mode (OS ROMs)
142 Data frame overrun (serial bus failure, OS ROMs)
143 Data frame checksum error (serial bus failure, OS ROMs)
144 Device I/O error (in peripheral hardware, OS ROMs)
146 Function not provided by handler (OS ROMs)
147 Insufficient RAM for graphics mode selected (OS ROMs)
160 Invalid Unit/Drive number, zero or greater than 7 (both MyDOS and OSROMs)
161 No sector buffer available, too many open files (MYDOS)
162 Disk full, cannot allocate space for output file (MYDOS)
163* Write protected or system error - disk is not readable (MyDOS)
164 File number link does not match the file's directory location (MyDOS)
165 Invalid file name (MyDOS)
166 Byte not within file, invalid POINT request (MYDOS)
167 FIle locked, cannot be altered (MYDOS)
168 Invalid IOCB (MYDOS and OS ROMs)
169 Directory full, cannot create a 65-th entry in a directory
-- entries may be used for "lost" as well as read files (MYDOS)
170 File not in directory, cannot be opened for input (MYDOS)
171 IOCB not open (MYDOS (really?!) and OS ROMs (sounds more like it))
172* File or directory of same name already exists in parent directory,
cannot create (MYDOS)
173 Bad diskette or drive, cannot format diskette (MYDOS)
174* Directory not in parent directory (MYDOS) (aka Directory not found)
175* Directory not empty, cannot delete (MYDOS)
180* Not a binary file (MYDOS)
181* Invalid address range for binary file, END < BEGIN (MYDOS)

* -- new error codes, not present or different in Atari DOS 2.

Most error codes are identical to those returned from ATARI DOS 2: the differences result from the expanded capabilities of MYDOS. Specifically, Error 164, indicating a file number mis-match, only occurs if the file is written in DOS 2.0 or 2.5 format. Errors 180 and 181 can only occur when XIO 39 (or 40) is invoked to load a file. (aka [L]oad in MYDOS/Atari DOS) Errors 172 and 175 apply to creating and deleting directories and have no ATARI DOS 2 equivalent; error 174 applies to accessing files in subdirectories, so it also has no ATARI DOS 2 equivalent. Error code 173 serves the same function as it did in ATARI DOS 2, but is returned more often (to identify bad diskettes more reliably).

---
all of the above (except typos, case-diffs, formatting diffs, and my comments) are extracted from the MyDOS 4.50 documents (not technical user guide), pages 18 and 19, section XIII. ERROR CODES AND THEIR SOURCES.

These obviously don't include language-specific errors (like BASIC errors), but it's a start!

Again, this is just the MyDOS 4.50 doc - available at the UMICH archives!

Well there is 2 Ways.

1. Buy an 850 / PR Connection / or a Blackbox and use a Null-modem between
your XL and the PC.

2. Buy an cheap old XT and use SIO2PC and put your programs on an IBM format
disk at any size you want.

4110. HELP! with SIO2PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-22 08:45:30 UTC
From: odaman@rocky.unoke.pfu.fujitsu.co.jp
Message-ID: <9407220842.AA05822@rocky.unoke.pfu.fujitsu.co.jp>
Source record: 99589

HI.

I got Sio2pc from UMICH today, and read docs yet. So, I find out
some strange points, and I want to ask about it.

I read that ATARI's SIO port has strange figure, so it is hard to
get it. But we must make circuit to use Sio2Pc. How can I get it??
Or if someone have it, please give(sell) me it.

And more one point. I need chips called "MAX232" or "ICL232?" to
make circult of Sio2pc. If someone have it too, please give(sell)
me it...

In Jpaan, it costs me about $10 to send money to foreign country. I
think SIO connector and chips are very cheap, so I don't want to
send money as possible as I can.

P.S. If someone use Sio2pc on AMIGA&PC-Task, please mail me details.
I don't have true PC, so I will try emulator of PC.

Thanks for your reading!! Mails are welcome!! :)

|> we can run on these. Any help or information will be greatly appreciated.
Just turning them on with no disk should do - unless they are very early STs,
the OS is in ROM.
If the OS is in ROM then you are now up and running. If not, then you can a)
buy some OS ROMS (if you can) or b) tinker with the boot disk so it just
contains the OS and doesn't boot anything else.
Assuming you have the OS ROM, you now need a WP. Do you want a commercial or PD
one? Do you want multiple fonts, graphics, spell checker, graphs, thesaurus,
style sheets etc. etc.? What level of word processing are you interested in?
There are some capable PD ones and some very capable commercial ones.
You would be better asking in comp.sys.atari.st as well, this is the wrong
group for STs :-)

Guess that's what I get for posting so late at night...NO, you or Rob is not at fault, I was just chiping in a couple of bits worth and didn't make my self clear.

What I was talking about had to do with some of the current flaming going on, and it is the digest site's admin who feels that some things just will not be said even in flames. To that end, I've been asked to delete articles in wich the author likes to toss around the 'ol F-word.

Anyway, it doesn't happen much and no real harm was done. Stress gets to everyone some times.

Yes it always has, but in this case we were talking about the current
shareware release of SpartaDOS which is why I spec'd G rather than just
saying something like Sd 3.2x which might have clouded the issue further.

I really shouldn't post at night...

I don't recommend trying to make use of the mirror.archive.umich.edu alias
for the following two reasons: 1) It doesn't support all the mirror archive
sites, only a few of them, and 2) several of the sites it does support
mirror other directories of the Merit Archives, but not the Atari
directories.

4117. 800XL, 1050, 850, rare drive FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-22 17:46:44 UTC
From: wattersm@ohsu.edu
Message-ID: <30p0m4$ipe@steele.ohsu.edu>
Source record: 99597

For Sale:

800XL $30
1050 Drive $30
850 Interface $40
Amdek Double Drive $75
Double Density (also supports single and density and 1/2),
double drive controller handles up to 4 standard IBM drives (3
extra 5 1/4 drives included), takes 3S disks (one spare drive included,
20 disks included).

Everything includes all power supplies and atari cables.
Also, with the CPU goes various controllers, with the Amdek
goes the 4 spare drive units, and an XT power supply and disks
(loaded with software), to whomever orders the most goes my
5 1/4 disks (about 80 blanks, plus 30 or 40 with various software)
and anything else in the box (including a home built voice
synthesizer, from instructions in ANALOG.

Buyer pays shipping

Lastly, one Apple III green screen monitor converted for
Atari, sound added. Available to the buyer of any of the above who
wants to pay the added shipping to transport this beast.

mike

In all cases, prices are OBO naturally.

In a message dated 7-20-94, David Deaven said:

"The point is, the emulators can only increase the interest
in the old classics, and, I wager, will increase dramatically
the amount of software produced for them."

How much are you willing to wager, what are the parameters (i.e.,
time limit for deciding whether there has been a dramatic increase
in amount of software, method for determining if that has been
attributable to emulators, etc.), and who holds the money? <grin>

Actually, that should be a half-grin, as I am half-serious.

Why would the existence of an emulator spur greater software production?
Poll the emulators and ask them: (a) How many are using their emulator
to assist in writing new A8 software. (b) How many would spend money
for new A8 software for running on their emulator instead of spending
the same amount toward new PC software. (c) How many how have an
emulator, but no A8 hardware have PURCHASED (including paying shareware
fees) any new A8 software for use with their emulator.

I might add the existence of Commodore 64 emulators (for the Amiga,
and then the PC) appear to have had no impact whatsoever on software
development for that machine.

In a message dated 7-21-94, Tim Hester said:

"I read a book quite a few years ago (Soul of the Machine)
(??) about how a computer named "Eagle" (I believe) was
designed and _emulated_ on a larger computer."

Well, since you are playing by the word of the challenge rather than
the spirit of it, so shall I. <grin>

Technically, what you speak of is a SIMULATION of a computer, as it
did not exist at the time.

If someone wrote software that ran on a PC (or other computer), and
was not only Atari-8 compatible, but also added such bonuses as an
80-column ANTIC mode, 65816-opcodes, megabytes of non-banked RAM,
etc.), then you would have something that might very well spur
development of new software (and once that was done, new, compatible
hardware). However, what you would have would be a simulation of a
computer, rather than an emulation, since no such 8-bit exists!

Simulation of new (and not yet physically existing computers) is not a
new thing, by any means. Apple purchased a Cray several years ago
specifically for designing and simulating new hardware.

Put another way, an emulator looks backward (on something that has
existed), while a simulator looks forward (to something which has yet
to be).

At best, I expect the only new software the emulator will generate
will be software specifically to assist the emulator software in
doing a better job of emulation. Even when one looks at perhaps the
best emulation of any computer (the color Macs on an Emplant on an
Amiga), one is hard pressed to see any evidence this has assisted
the Mac software and hardware market in any way. Lest some be quick
to point out that the Mac is a "living and growing" machine (vs. whatever
status they might attribute to the A8), take a look at the TI-99/4A
PC-based emulator 64 PC-based emulator, and the one Mac-based emulator,
and see if you find any evidence they have contributed to any advances
or new software for those machines.

Lonnie McClure wrote a few posts re: emulator probably won't add to software
(ie, people won't program Atari stuff on their emulator)

Well.. be that (what you said) as it may for the C=64, Mac, etc.. how many of
those machines have GOOD programming environments.. I consider TurboBASIC XL
and Action! to be about the best environments for programming I've ever used.
Compare this to what I've seen of, say, the Commodore 64.. I mean, that system
seems IMPOSSIBLE to program on as it stands. Sure, it has BASIC built in,
just like the XF2 does and the XF3 will, but it doesn't have a readily
available DOS menu like MyDOS/AtariDOS. It doesn't have a good CLI that
I've ever seen, like SpartaDOS.. The BASIC that's built in gives you very
little control (EASY control, that is) of the system.. the OS, the graphics,
the sound, the controllers. Everythings a POKE on that damned thing! :)
On the other hand, it does have GEOS and some GEOS programming kit, but I
still think that there's a much better chance of people sitting down and
writing at least SOMETHING on their XF2's than on their C=64 or Mac emulators.

Am I making any sense? I mean, I programmed a LITTLE on my brother's C=64, I
did some crappy stuff on my 2k TImex Sinclair, but when I got the Atari, I
had the ability to do sound (not the GREATEST, but I never had ANY sound on
the C=64 stuff I wrote), controller input (versus looking up stuff in Mapping
the C=64 all the time), etc..

Anyways.. perhaps I'd better stop bitching about the C=64 and stuff because
from what I've seen of it, I've only seen HALF of what it can do, I'm sure..
my brother isn't exactly up to date in the C=64 world lately. I posted a
query on comp.sys.cbm asking about the C=64/128 TODAY and told them about the
Atari 8bit TODAY (hard drives, 4096 color mode, etc) and they've come, at
least technically in some senses, as far if not father in some ways, as the
Atari 8bits...

I still like MyDOS the best though ;) THat and TurboBASIC XL ANY day! :)

Point taken! (emulation vs simulation)

But - (here we go again) :-)
Wouldn't the "Eagle" computer have been in a schematic
stage during its design? If so, then the larger computer
mentioned would have been "emulating" the computer
that already existed on paper. :-)

I understood the "spirit" of your challenge, but
being a die-hard nitpicker (or *sshole to some)
couldn't resist throwing in my .02 cents.

I don't know about those other emulators that you
mentioned, but I can't see why it would be unlikely
for any new software for the 8-bit to be developed
on the emulator. Think of it: an Atari 800 emulator
can be run on a laptop. Goes anywhere. With a
processor like a 386/33 or better, coding and compiling
would go _much_ faster on the PC than the Atari.
Someone here has already stated that they plan to
do just that. (in place of pencil and paper that they
used beforehand) Why would it be any different than
software written for an Apple or C64 that was then
ported to the Atari? Someone here was doing blipverts
for some game that they'd written for the PC and was
working on an Atari version. (yet to be released as
far as I know) Maybe the emulators for those other
machines were not very good? Maybe users of those
old machines didn't care if anyone developed software
or not. Who knows? All I know is this: I would
rather be optimistic and >hope< that something good
for the 8-bits comes out because of the emulator.
Just like I am constantly >hoping< that something
new and interesting comes out through the normal
method; on a physical Atari.

Considering how much comes out from the latter,
you realize my "hopes" are almost pie-in-the-sky.
But they're hopes just the same.

2 cents, 2 bits, whatever. Anyways, just to add another nit, there would have been a period where development of the hardware would be partially complete, and debugging of the schematic design would be proceeding, when the simulator might be considered to be at least an attempt at emulating a real (but not quite working properly) machine. Or would the machine be emulating the simulator? Such semantic games we could play with this.

From: aa700@cleveland.Freenet.Edu
Message-ID: <30rpnu$qht@usenet.INS.CWRU.Edu>
Source record: 99518

In a previous article, hwl0978@gemini.tntech.edu (Hiram Lester, Jr.) says:

>>3.2g/gx is just as much shareware as 3.2f is.
>
>SHAREWARE? Boy, I REALLY have missed out then? Is it on a.a.u.e, and what new
>features are incorporated?
> Hiram

3.2f is in the 8bit/Fte directory, but last I checked 3.2g wasn't there
yet.

This file is in the 3.2g distribution:

What's new in SpartaDOS version 3.2g

****

Version 3.2f could only access drive
ID numbers from D1-D8. Now, you can
access drive D9.

****

A filespec that does not contain a
drive number, such as D:TEST, will
now default to your currently logged
drive on the command line.

For example, if you are logged to D4:
a filespec of D:TEST will be converted
to D4:TEST, instead of D1:TEST as it
used to be. This change can be very
useful when running programs from
different drive numbers, since you
can access files with D: and they
will automatically be taken from
whichever drive the program was
was started from.

You must now be careful however, to
always type D1: when you need to
access drive 1 specifically.

****

A file will no longer be destroyed
when copying it to itself. The DOS
checks for this condition, and will

report a 'File exists' error.

Commands such as:

D4:COPY D4:TEST

will no longer destroy the file TEST.

****

All command line input, including all commands, files, and drive IDs, can now be entered in either lower case or upper case. Lower case was only partially supported in version 3.2f.

****

Some commands have been changed, to make them more compatible with the X cartridge, as well as making them easier to type. The following changes have been made:

CWD has been changed to CD.

CREDIR is now MD (Make Directory).

DELDIR is now RD (Remove Directory).

Note that with the Remove Directory function now called RD, the RD.COM ramdisk handler needs to be renamed to RM.COM in order for it to work.

(This will be the name of the MARS8 compatible driver to be released.)

****

There are many additional error messages, so you should no longer see error numbers on the command line.

****

A system lock-up bug has been fixed, when the clock wraps from 12-31-1999 to the year 2000.

Also, the day of the week offset has been corrected for years after 2000, in the new TDLINE program.

We are 5 1/2 years 'ahead of time'<g>

****

Program files containing a RUNAD, can now be reentered with the RUN command after returning to DOS. The normal process of saving the starting address for a .COM file into Sparta's internal variables, was disrupted when the file contained a RUNAD address. This has now been fixed, so all program files will behave the same way, whether or not they include the RUNAD address.

****

Several changes have been made to the keyboard buffering routines. When holding a key down for auto-repeat, the buffer will not fill up with excess characters that the application program hasn't used yet. There will at most, be one additional character in the buffer during a key repeat.

This means that when you release a key, the repeat process stops right away, whereas there could have been many additional keycodes 'stacked up' when using version 3.2f.

The key combination Shift-Control-Esc can be used to clear all of the keys currently stored in the buffer. This gives you a way to cancel everything in the buffer when a situation may require you to abort.

****

The 1200XL key functions such as DMA off, keyclick toggle, and keyboard lock, now work properly.

****

The key buffer NOW DEFAULTS to OFF due to incompatabilities with certain programs. It can always be activated as part of a STARTUP.BAT file using 'key on' (even in lower case), if you would like this feature enabled.

****

The AINIT command was removed from the command line. However, the XIO Atari format function can still be used within application programs.

****

Even with all these changes, the DOS file size has been reduced by 260 bytes, and the lomem has been dropped 119 bytes. If you do not have a PBI device, your lomem will be at $17A2.

Users with a PBI device will find their lomem at $1BA2, since the buffer space uses 1K at lomem, instead of the $D800 PBI area.

****

FTe has decided to release a special 3.2 'gx' version that can bring memlo back down to $17A2, by placing the disk buffers under the OS at $C400. This has an added benefit of using a full 2K of buffer space, instead of the 1K space allocated at memlo, and will help the DOS run faster.

However, SpartaDOS 3.2 'gx' is NOT COMPATIBLE with BASIC XE, or any other programs using the RAM under the OS from $C400-$CBFF. It is provided for those users who don't require this compatibility, and who would like to have the additional RAM available.

NOTE that if you ARE NOT using a PBI device, (such as an MIO or Black Box) you do not need the special 'gx' version, and will already get the 2K buffer space and $17A2 lomem with using the STANDARD 3.2g version.

****

SpartaDOS 3.2g and 3.2gx are being released as Shareware on an AS-IS basis. If you do happen to discover any incompatibilites, please don't hesitate to let us know, so that we might be able to fix the problem in any future revisions.

This upgrade was made possible by
everyone out there who took the time
to register 3.2f Thank You!

****

If you like what you see, you may
register 3.2g by sending $19.95 to

Fine Tooned Engineering

PO Box 66109

Scotts Valley, CA

95067

This will get you all 3 manuals in
addition to the SpartaDOS Toolkit.

****

Slight problem: the emulator can't run Action, or any other
cartridge-based language. Or has FTE released a disk version?

There is a disk version. An official disk verson. I'm not sure if FTE sells it but ICD did. Obviously the action cartridge was more frugal in dealing with memory because it could hide part of itself in banked ROM. Basic XL is a great example of the benefits of banked ROM vs. TurboBasic XL which took up twice as much RAM because everything had to be resident at one time. Tom Hunt was using the diskbased version a lot and it has a few disadvantages to work around.

Yes, any emulator must deal with cartridges SOMEHOW.

There are far too many Atari 8-bit cartridges to just ignore.

CI$ in '87? I think I posted the name there, but it's slipped from memory now. Something odd like mogorn??? It's not really pertainent to the game though, all you get is a pulse rifle with some ammo. I think you are then told to get the Radiation suit in that hallway that doesn't let you go to the end of it. You get some other odd instructions like meet me on the other side of the bridge <by the undead knights> & then end up in Revelation. Only problem is without the Revelation disks you lose your character.
Rick

4144. A Death In The Family?

I was just reading the newsgroup alt.culture.internet a
minute ago and came across the subject: "A Death in the Family".
Therein, Alan Sondheim reported that a "Michael Current"
had died of an insulin overdose.

Is this our very own "Michael Current" who frequently posted
to this group?

If it is, I am truly saddened.

I've heard tell that as many as 200 1450xld's had been released by Atari
prior to droping 'em. Then again, I've also heard that there were as little
as 20... Guess it all depends on who you talk to. Still, there are a number
of 1400 MB's out there that can be had for something between $50 and $200
again depending on who you talk to.

A 1450xld would be an interesting addition to my collection, however, it looks
as though I'll have to be happy with just the 83 catalog and some nifty pic's

Take care

Issue's 17 and 18...and speaking of Analog...just before starting TP5.20
I had to get Ronnie a copy the Analog disk from Issue 56...

Ronnie had been using a basic program to de-seg his files, then I showed
him StreamLiner...He said he was going to make a mod to the source code
to allow him to get back to dos...

There is an OSS disk based version of Action! that is slower than a
1541 disk drive (in joke). This version of Action! is also full of
bugs that were fixed in the cart based version. Now as far as Mac/65
goes, Fte has released the disk based version in ATR format ready to run
with the PCXF.

```
CAIN Atari Fun Fest 94
----------------------

CLEVELAND, OHIO is within 500 miles of half the population in the United States
and a very LARGE population of Canada. It is a great place for an Atari Show
because most people aren't too far away!

The CAIN Atari Fun Fest 94 will be held in Kirtland, Ohio (very close to
Cleveland) and will allow Lynx and Jaguar owners to have a lot of fun!
There will even be a "Cleveland Lynx-Up" where Lynx owners can bring their
Lynx and game cards and comlynx with other players! Who says that you'll never
get the opportunity to comlynx???

Jaguars will be there to play and you might be lucky enough to take one
home with you (courtesy of Atari Corporation).

There will also be dealerships attending this show that will be more than
happy go give you great deals on game systems and game cartridges!

If you are an Atari computer gaming fanatic, not to worry! There will dealers
there to supply you with all your computer gaming needs...

Dealers:

If you are interested in selling your Atari merchandise, this is a fantastic
opportunity for you to do so! But you must register now! The tables are
being sold quickly! Contact the show organizers immediately!

User Groups:

Several tables have been set aside for user groups! If you are interested
in representing your user group, contact the show organizers! Since
user group tables are FREE, the user group tables are going quick so don't
delay or there may not be any tables left!

PLEASE distribute this on BBSs, networks, and at your user group meetings!
We want to have one heck of a gaming day! And a gaming day that might be
closer to you than you think!

CAIN Atari Fun Fest 94
----------------------

Central Atari Information Network
Presents
C.A.I.N. Atari Fun Fest 94

A similar thing happened to me when I first started BBSing about
2 years ago. It seems someone by my same name had won a contest in
Antic or Analog for AMP music composition or something. Not only did
he have the same name but lived in the same town as myself. This is
strange because I think there is maybe only one other Saunders in my
home town (from the phone book) and the odds of a Glenn with 2 'n's
is 1,000,000,000 to 1. So something screwy happened there, I don't
know what. I don't have that issue so I can't absolutely confirm the
spelling or anything else.

Another strange coincidence, huh?

Oasis' programmer?

4163. Re: Atari 800 + goodies

OK! I got sevreral responses from people about this. I'll sort through
and get rid of it soon. If someone doesn't write to tell me they want
to pick it up I'll ship it Tuesday to NH.

Thanks for keeping the land fills empty! :-)

Garry

4164. Atari 8-bit Newbie/Stupid Questions/Emulator Help F.A.Q. Rev.0.3

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-25 03:22:10 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940724202211.24006ae7@sonoma.edu>
Source record: 99546
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit

Here's rev.0.3 of the Newbie/Emulator FAQ. It's being crossposted to both comp.emulators.misc AND comp.sys.atari.8bit, because it does have a lot in it which has little to do with the emulator (but is there because there are more new Atari 8-bit users because of emulators than anything else these days, or so it seems). This revision is as of 7/23/94.

FAQ `\\ //'
`\/'
By Bill Kendrick
Revision 0.3 !! PLEASE !!
July 23, 1994 ASK MORE QUESTIONS

Differences from Rev.0.2: Added where to get (FTP) mentioned files, e-mail and postal mail contact addresses, removed bad (space-wasting) formatting in the "XIO" section, did minor editing here and there. PLEASE also refer to: MyDOS 4.5 documents, SIO2PC documents, XF2 documents, and the Atari 8-bit F.A.Q.

For general help (hardware, magazines, etc.) please check the Official Atari 8-bit FAQ file:
From: Michael Current <MCURRENT@carleton.edu>
Where to get the latest copy of the Atari 8-Bit Computers Frequently Asked Questions List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto::mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/faq
quit

Finally, you can always ask Michael for a copy at
mailto::mcurrent@carleton.edu

Objective of this file:
Much discussion has gone on in the comp.sys.atari.8bit Usenet newsgroup about the newly released (mid 1994) Atari 8bit emulator for IBM / MSDOS based computers, the PC X-Former 2.0 (XF2 for short). Many people in the 8-bit community have gotten, well, fed up with the XF2-based questions which do not pertain to them, or to the really dumb questions which are in fact understandable to new or rusty Atari 8-bit users, but have just gotten on the nerves of some of the comp.sys.atari.8bit readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2 questions.
This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL) and "how do I get a disk directory?" (which is less obvious on Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a suplement for the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

---=== XF2 Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System (which XF2 does not emulate).
A.2.2) Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.
A.2.3) It may just refuse to run on the XF2 emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported on the XF2.
A.4.2) (See Question 2).

Q.5) How do I exit XF2 and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XF2" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF2.ZIP file).

Q.7) How do I use MSDOS files with XF2?
A.7.1) Add the files to the command line and use them as their respective

drives (be sure the first drive is a DOS-bootable disk image).
Example: XF2 MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XF2 which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XF2 from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XF2. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XF2 and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the XF2
(and the S2PC program mentioned above). .XFD files are used by
ST X-Former (the Atari 8-bit emulator for Atari ST's) and
PC X-Former (XF2).

Q.9) What's SIO2PC?
A.9.1) Refer to the XF2 and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XF2 does) as a single file all alone in
its own disk. It also currently allows Print-Thru (all access to the
Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.50 (because these topics seem the most
relevant to the less-knowledged/experienced XF2 users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")

[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XF2, it's much quicker to just copy one .XFD or .ATR to
another).
[K]
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and

you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)
disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more

than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN
that normal directory, or even another subdirectory. For example,
you can have your disk divided up into the "GAMES" files, the
"GRAPHICS" files and the "SOUNDS" files. A directory of the disk
(the "root" or "base" or "trunk" directory) will simply list the
three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then,
if you ask for a directory listing of the "GAMES" subdirectory,
you will see the files (and perhaps other subdirectories) within
the "GAMES" directory. Think of it as a tree. For people familiar
with Macintoshes, "Folders" are simply subdirectories. A window
which appears when you open a "Disk" Icon is the "root", and all
of the "Folders" within it have more windows in them which also
have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes
are not necessarily using drive 1, and MyDOS and SpartaDOS may
already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current'
or 'default' directory to a different place (a different drive or
a subdirectory). "D:" can stand for "D1:" (like AtariDOS always
does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR
DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:

C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory,
files, multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS)
E: editior - readable, writeable. This is how input from the
keyboard and output to the screen is normally handled. If
you wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
K: keyboard - readable. This is just the keyboard. Input from
it is not 'echoed' back like with the "E:ditor".
P: printer - writeable. Send data to this and it will appear
on the printer. You can print files (documents, etc.) by
using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed

by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference
Manual). (As of today, 7/23/94, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XF2 users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics

15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XF2 doesn't support sound! But, anyways, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right

ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them.
When simply entering text, type [ESC] then the edit key and the
character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an
ESC beforehand, so first type [ESC],[ESC] to make an ESCape character
appear, then type [ESC] then the edit key and the character for that
edit key should appear. When the PRINT statement is executed, the
first ESCape (which you typed as two [ESC]'s) will make the editor
SHOW the following character (even if it is an edit character), then
the character which you entered (with [ESC] and then the edit key)
will make that character appear. This makes it difficult to align
a set of PRINT statements which make a multi-line picture or menu
which uses viewed edit keys. It is probably best to have all of the
lines in your program with the PRINT statements that can fit visible
on the screen, then edit them (without putting any of the ESCape
characters in, then when the picture looks like how you want it on
the screen, move the cursor to on top of each edit-key character and
press [Control]+[>] (Control-Insert). A blank space should appear
under the cursor and the rest of the line should move right. Now,
type [ESC],[ESC] and an ESCape edit-key character should appear
where the blank space was. When you are finished doing that for
each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE
PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1"
to turn on the no-edit mode (ALL characters except End Of Lines
will appear, even ClearScreens!) When you want to go back into
normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc)
minutes, the screen colors begin changing, thus protecting your TV
or monitor from having a static image burned on it.

To turn this mode off, press a key, or, if within a program, use the
command "POKE 77,0" at least once every few minutes (IF the screen is
active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having
location "77" set to "0", or set location "77" to "128" with
"POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file

XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection

available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
board or account you have access to, and then connect the modem
to your IBM and download the files.

---=== Where to FTP files mentioned in this FAQ: ===---
The PC X-Former can be downloaded from the "ftp.clark.net" FTP site:
Directory/file-path: systems/msdos/emulators/xf2.zip
The following programs are availabel at the "archive.umich.edu" FTP site:
SIO2PC: atari/8bit/sio2pc/*.* [all files are SIO2PC/utility files]
MULE: atari/8bit/Utilities/????
Util: atari/8bit/Utilities/????

AGAIN, >>> PLEASE <<< CHECK OUT THESE OTHER FILES:

WOW!!!! Thanks for this VERY exhaustive listing of what has been changed. This sounds REALLY GREAT!!!!!! I think I need to get it. <g>

>Some commands have been changed, to
>make them more compatible with the X
>cartridge, as well as making them
>easier to type. The following changes
>have been made:

Are the commands CHANGED, or will both commands work?

Also, will XINIT FINALLY initialize an enhanced density disk on an Indus? Whenever I tried it, it flipped the drive over to single and then tried to write to the drive as if it were enhanced (producing one screwed-up disk). The only way I finally got it to work was by switching the drive density just after it switched it, and the before it started initiallizing. It was tricky timing it, and didn't always produce the desired results.

Can't tell you that, unless it is coming through some kind of a relay that is
mutating the address. That's a distinct possibility.

If your newsreader allows you to modify the headers, you could add a line like
this:

Reply-to: <email address>

and any replies should be directed to this address. Some newsreaders allow you
to define a reply to address automatically.

4169. 1450XL FOR SALE!!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-25 04:11:15 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407250410.AA166619442@relay2.geis.com>
Source record: 99550

----------==========>>>>>> 1450XL FOR SALE !!! <<<<<<==========----------

Ulllpppp! The gods will punish me for this.....

I have a 1450XL, in pristine condition, to sell.
Sadly, I must finally acknowledge I don't have the time it will take to devote to this machine & unravel its secrets. The guilt is killing me. I want to pass it on to someone who will give it the love & attention it deserves.

PRICE: $210.00 firm. USA buyers ONLY. Price includes shipping.

DESCRIPTION:

This is a rare Atari 1450XL (NOT XLD!!) in mint condition. It's in a sort of 1200XL case (even *says* 1200XL), but the bottom case half is quite different from the standard 1200XL hardware. The noticeable differences are: 1.) A PBI; and 2.) two RJ-11 ports for the phone connection to the built-in modem. Some of the other ports are in different locations than a 1200XL.

As far as I can tell, the unit appears functional. It seems to be a line-production prototype-- all wave-soldered board connections, very clean, no wire-wrap or rat's-nest stuff. The built-in speech chip DOES work (as you discover when you enter the OS!). It has the usual cart port & joyports on the left side like the 1200XL. On the rear panel it has the usual SIO, RF, & A/V ports like all the 8-bits, in addition to the PBI & phone ports. The power jack is slightly different than the other XLs have (more pins!). I described some of this machine's video circuits in the December '93 ATARI CLASSICS.

I do not know how to access either the speech chip or the built-in modem. I am told one of the Chameleon terminal emulators can address the modem (not verified). You'll be on your own for that stuff.

ACCESSORIES:

The following will be supplied along with the unit:

1.) Atari custom power supply (the Mother Of All Bricks).
2.) Schematics for the 1400XL (not exactly the same, but close).
3.) Custom leatherette cover.

The schematics are full-scale engineering drawings, bulky & in some places a little hard to read.

I'll throw in a spare SC-01 speech chip for an additional $5.

WHAT YOU DON'T GET:

1.) A manual. Prototypes don't come with manuals. No big loss, all Atari XL manuals were a joke anyway.

2.) RF shields. Looks like development on this baby was slashed just as they were gearing up for production; no shields were ever made.

BUYER REQUIREMENTS:

1.) You must have the money.
2.) You must be willing to give this rare machine a good home. It is quite gregarious & requires the company of several other Atari XL-class machines, preferably 1200XLs or 800XLs, in order to ensure its continued emotional well-being. If placed by itself it will die of loneliness. It exhibits severe adverse reactions to the presence of any type of MS-DOS machine in the immediate vicinity, keep those well away.
3.) The 1450XL *craves* attention from its owner & *loves* to be booted up. It also enjoys having its hardware stroked & fondled (gently, of course). The buyer must be someone willing to take the time to explore this machine & sift out its secrets. Guaranteed love-affair for a serious hacker.

CONTACT: Ben Poehland b.poehland@genie.geis.com (serious inquiries only).

4171. Hard Hat Willy?

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-25 05:22:48 UTC
From: toastman@armory.com
Message-ID: <30vi78$iqn@nic.scruz.net>
Source record: 99552

Everyone, check your games collections for HARDHAT.OBJ and make sure it's not yet another pirated copy of Hard Hat Mack.... there was a game called Hard Hat Willy that I got off Pandora in the 80's, and I enjoyed it quite a bit... then, later, the disk corrupted, and the file was deleted from Pandora, and I haven't seen it since. Every HARDHAT.OBJ I ever got since then was Mack..

If anyone has that game, could they by any chance upload it to umich, or post it somewhere, or mail it to me?

I'm also looking for an FTP site with old Antic or Analog game archives (are they PD yet?)... but I'll read the FAQ for that.

4172. New at the archive

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-25 07:09:22 UTC
From: snyder10@rs5.tcs.tulane.edu
Message-ID: <30vof2$b5l@news.cs.tulane.edu>
Source record: 99553

I've just uploaded a number of requested file to the archive at UMich.
(atari.archive.umich.edu) These files should be moved to their proper
places within the archive system within a few days.

FT80v037.arc

FlickerTerm 80 - Written by Clay Halliwell, this is the terminal program
that we've been talking about for a while. FlickerTerm is still a work
in progress, so as it stands FlickerTerm is a very fast dumb terminal.
FlickerTerm supports modem speeds up to 14.4 (w/o modem compression) with
out the need for flow control. Both vt100 and Ansi screen controls and
graphics as well as brights and blinking characters - if you call alot of
MsDOS based BBS's, now you can see what you're missing.

FTE32g.arc

SpartaDOS 3.2g - By Fine Tooned Eng. This is the shareware release of
the current version of the disk based SpartaDOS. 3.2g includes a number
of bug fixes and changes and is a general inprovement over 3.2f.
Note: older versions of shell.com by Tom Hunt do not work with 3.2g

ShellGX.sfx

Shell.com - Written by Tom Hunt of CTH, this is the shareware release of
the current version of Shell.com Shell.com adds a search path to SpartaDOS
3.2g, checks for open files and keeps you informed as to where you are within
you file system. This is an upgrade to work with SD3.2g

TP520x.arc

TextPRO 5.20 - Written by Ronnie Riche, this is the shareware release of the
current version of TextPRO. Note, the docs for using this version of
TP are not included with this file, but may be had for a minor shareware
fee (see the readme file inclosed)
(reg'd users of TestPRO, all 50 of us, will be getting the complete package
in the mail within the next few weeks...this package includes everything on
the dist. disk, source code, docs's and everything one needs to write
addin's)

As I said, everything should be moved to their proper places within the
archive in the next few days.

: There is an OSS disk based version of Action! that is slower than a
: 1541 disk drive (in joke). This version of Action! is also full of
: bugs that were fixed in the cart based version. Now as far as Mac/65
: goes, Fte has released the disk based version in ATR format ready to run
: with the PCXF.

Do you know whats so cool about the emulator? It takes less than a second to load any game, utility, aplication, or demo. To do this on a regular Atari it would take awhile to boot off of floppy. This goes for bootdisks also! It takes less than a second.

Not only does it load faster, the software runs faster as well! This makes for the perfect 8-bit, I am going to buy version 3.0 and that should even be faster with a 32-bit version of a 130XE! wow!

You are invited to come Join us at ACE of America. You do not need to be a Member to Come. Upcoming Meetings will consist of a Raffle and a Swap Meet. Our raffle will consist of Prizes Donated at the Last Swap Meet and other Donations including IBM Compatible Keyboards, Hard Drive Mechanisms, Disk Drive Mechs, Software for the IBM, Software for the Atari ST, Atari Classic 8 Bit HardWare and various gift certificates. Their is still time to donate Item's for the raffle. If you have something to donate for the raffle, call (503)256-9974 or Come to the Raffle and Donate their. If you have a business and can donate, please do so. Even Gift Certificates are welcome. And if your an ACE Member, your first Dollar's worth of tickets are FREE!! This Raffle will be August 1st. Meeting starts at 7 PM.

The Following Months meeting will be a Swap Meet. All club Business will be suspended. Tables are 10$, But if your a Member, IT'S FREE! Also FREE ADMISSION. And we expect a good Turnout because we advertise our Swap Meets. This Swap Meet, Due to the Holiday, will be Held Tuesday, September 6th, starting at 7PM.

Meetings are Held at the NW Service Center in the Basement at 1819 NW Everett. In Portland, Oregon. Plenty of free Parking!!! For more info: Call Ben at (503)256-9974, anytime.

I know this one, yeah. Willy was surely the cutest game character I ever saw!
I loved the way you could extend his tentacles and then move his eyes around.
And I recall the death sequence never failed to bring a tear to my eye. We
never did agree on what he turned into after he was zapped, I insist it was
a puff of smoke but others claim it is an angel. Perhaps you can help us out:)

>then, later, the disk corrupted, and the file was deleted from Pandora, and I

: j >My main interest was in messing with the speech capabilities--thought it woul
: j >be cool and a neat addition to my 8 bit collection. Alas--hundreds of dollars
: j >is a bit too much for me right now):

: I've heard tell that as many as 200 1450xld's had been released by Atari
: prior to droping 'em. Then again, I've also heard that there were as little
: as 20... Guess it all depends on who you talk to. Still, there are a number
: of 1400 MB's out there that can be had for something between $50 and $200
: again depending on who you talk to.

Okay... lets take inventory...
I know of a local friend who has one 1400xl... hand written serial numbers
on the buttom and the words "proto." Also..the modem is wire wrapped.

Now, as I understand it... there were several?!?! revisions to the
14xx line of boards... in that a 1400xl board was a 1450 with just the
missing floppy drive controller PLUG IN board....but only on some
boards.

(Oh, the speach is really fun to play with. And you get to use those
few rare programs the only run on a 14xx machine.)

Now, could somebody tell me where the heck the 1250XLD came from?!?!
I heard people say that they saw some in pictures that were supposed to be
1450's. Just recently I uncovered the Atari Learning Software ??!?
catalog and there was a picture with the heading of "1450xld" but, the
computer had a 1250xld label.

So... what? first came the 1200xl and then they thaught of the 1250?
then they scrapped all that for the 800xl's and then 14xx? or
was it 1200, 1200xl, 800xl, hmm 1250?? no..1450.

oh..there are 1200's. Not sure what the differences are...

Wish...really really wish... we knew who the designers were and could
get them to tell their story of it all......from day 1. Hmmmm..sounds
like a good book. Anybody want to spot me air fair to CA?! =)
That and have Atari release or FIND their old schematics... notes..etc..
heck they could make some (not a lot... but some..and money is money right
now since they need it) money by releasing all those little things they
thought we would never want. Heck..I would pay $20 or more for a copy

of the 14xx designers notes!

$800 for a working 1450xld... hmm...and that price...will never change. =)
the 1400xl cost my friend close to $300. Hmmm...wonder if I could
get it from him. heheheh

Andrew

Glenn M. Saunders (krishna@max.tiac.net) wrote:
: There ARE No good 1200XLschematics.

: There is one with "errors" in it.

: The only person who really knows the 1200XL is Bob Woolley.

: Maybe he has some hand-done schematics.

Maybe I am in the wrong here...but aren't changes supposed to be
done to schematics before production?!? I mean... I don't just sit down
and draw out my 68000 computer schematics only to make changes later
and never update them! BAD BAD BAD designing there!

Someone should get a copy of the computer templates... oh way.. that
was before they had computers to do that kind of stuff. =)

Then again... I dont like spending my life tracing 1200xl mother boards.
Especially that evil video circuit!

And uh... how do you know about the "errors".... would it not be
easier to correct the ones on the bad sheet than to start over?

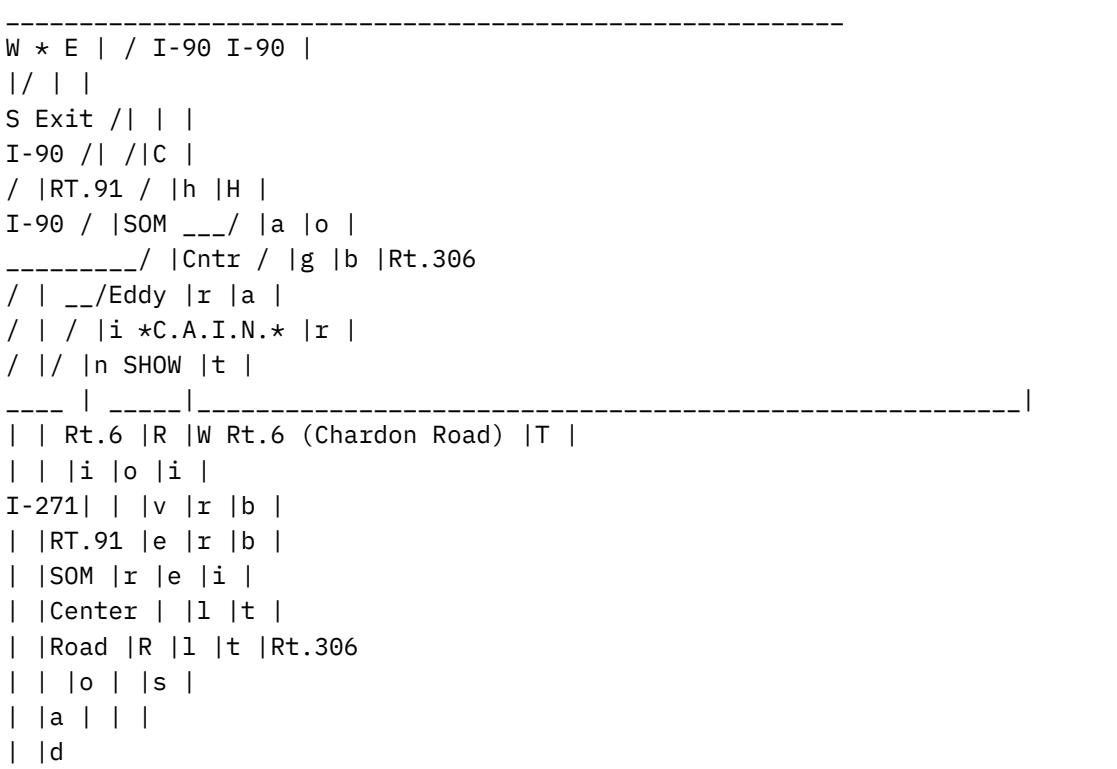
Ok, the directions posted along with the CAIN Atari Fun Fest 94 Show Announcements (a few days ago) is inaccurate. These are not only more accurate but less confusing!

Map to CAIN Atari Fun Fest 94

Knights of Columbus Hall, 7637 Chardon Road, Kirtland, Ohio

Map to all the Fun!



If traveling I-271 North, keep going North then take I-90 East to Route 91 (SOM Center Rd.). You will go South on Rt.91 to Rt.6 (Chardon Rd.) where you will go East for several miles until you are at 7637 Chardon Road.

If traveling I-90 South, exit at Bishop Road and head South until you reach Chardon Road. You will then go East for several miles until you are at 7637 Chardon Road.

If traveling I-90 West, keep going West then exit at Route 306. You will go South on Rt.306 (passing Eagle) to Rt.6 (Chardon Rd.) where you will go West for several miles until you are at 7637 Chardon Road.

4184. <cry> I tried it all

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-25 17:03:03 UTC
From: pab@cnx.sccsi.com
Message-ID: <cf6_9407260315@cnx.com>
Source record: 99447

Half naked and half sedated, KENDRICK@SONOMA.EDU ran through the streets
screaming something about "<cry> I tried it all...."

K>HOW DO I TURN OFF A VBI ?!

KILLVBI JMP $E477 ; <grin>

Seriously, the only VBI's I've ever used were clock or other timing
routines, which I didn't WANT disabled. I've usually relied on warm
(and occasional cold) start resets to turn them off.

K>BUT.. I cannot seem to find any (clear) documentation on "how to turn of a
K>user
K>VBI".

The only two options I can think of are:

(1) Disable VBI's altogether:

```
NMIEN = $D40E ;Non-maskable interrupt enable
LDA NMIEN ;Get current value
AND #191 ;Turn off bit #6 (VBI enable)
STA NMIEN
```

This is a messy option, however, since the OS uses VBI's extensively,
and might get angry that you threw a brick wall in its face.

Your better option is to store the old value of VVBLKI, which should
have the address of the stage one interrupt stored in it on start-up and
reset.

```
VVBLKI = 546 ;VBLANK immediate register
LDA VVBLKI
STA SCRATCH ;Wherever you can store it to save it
LDA VVBLKI+1
STA SCRATCH+1
```

When you want to disable your interrupt, do the reverse.

Also, note (I forgot to point this out) that you'll have to end your
interrupt NOT with an RTI (as DLI's do) but by indirect-jumping to this
address:

```
JMP (SCRATCH)
```

To make sure the OS VBI goes off.

If you're doing a non-critical VBI, one where timing is not of the
essence and you have a few more system kliks to play with, use VVBLKD

(548) in place of 546 in the above example.

K>Also, it crashes before anything happens when I tell Action! to compile my
K>procedure to page 6 and then tell SETVBV that that is where it is. :(:(
K>:(

DON'T use SETVBV. You're better off setting it yourself. (Note that
you'll probably have to do it in machine language and NOT Action! to set
it fast enough) Stash the old value of VVBLK(I/D), end your interrupt
with the appropriate JMP instruction, and store the routine's address in
the vector as needed.

K>Q: What's the difference between RUsh Limbaugh and the Hindenberg?
K>A: One's a Flaming Nazi Gas Bag and the other's just a zepplin!

Unfortunately, this one is old. We need newer, better, Limbaugh jokes.

Thanks for the interest in the Atari 800 and accessories I was trying to GIVE away. The range of responses ran from one end of the spectrum to the otherOne guy only wanted it if I had all teh documentation and extra discs. Another wanted to know if it included a color monitor (Of course I would give away a monitor!) :-) Another wanted me to meet him halfway and deliver it. seems 30 miles is too far to drive. Another wanted me to hold onto it until he came to DC thins Winter at Christmas time. I'm cleaning out my junk!!!! Another guy wanted to know what kind of disc drive it had and if it came with an interface for the printer and a modem. Another wanted only the BASIC cartridge. Several claimed to be willing to pick it up "sometime". I see these things for sale here and I actually expected someone to jump at the chance to save it.

For future reference if someone is giving something away I suggest those interested include their phone number or physical address rather than simply continuing to post E-Mail with more and more questions.

For the guy in Rockville: Sorry you live too far away to pick it up.

For the guy in Alexandria: Your brother didn't show up. I waited 45 minutes for him. :-(

For the courier: Do you check your E-Mail?

For the guy in NC: If it were pristine I would be keeping it!

For the woman in Richmond: Yes I do travel on I-95 but I'm not inclined to deliver it. :-)

For those who wanted bits and pieces: Check the yard sales or computer junk shops.

For the guy who sent his address and offer to send a check for shipping: It'll be there soon!

Garry

4186. Disk access vector on MyDOS

Newsgroup: comp.sys.atari.8bit

Message-ID: <31155b$3b7@tunga.inf.utfsm.cl>
Source record: 99414

Hola mundo.

I want to write an util which requires to read/write some sectors on
any drive attached, including ramdisks, hard disks, SIO2PC, ...
without using CIO, but SIO.

Is there any vector other than $E453 to JSR with the proper data
on page 3 ($300-...) ? The location depends on the version of MyDOS?

Also, what I have to do to recognize a disk to be in MyDOS format?
A flag in some sector? 360? How can I know the sector size before
reading?

One more. A double density disk has only 4 sectors for the main
directory (and each subdir) ???

Quite hard questions, I know... ;-)

Thanks... Bye... ++Vitoco

Am I so different from the other c.s.a.8'ers? Now.. I'm not complaining, it's just I've had this happen a few times before...

People who are farther out from the net or the US or western Europe sometimes start mailing me (Odaman from Japan, some Atari user group from Russia long ago, I think someone from South America somewhere?) and asking questions..

I love the mail.. I love (REALLY love) helping people, esp. when it comes to the Atari 8-bit (and other computers)... but.. I mean, at a glance of comp.sys.atari.8bit, what's so special about ME that people decide I'd be a good person to ask stuff to? I'm by no means an EXPERT.. I know bits and pieces at most for many things (just ask Itay :) .. hehe.. Itay, you're always asking me stuff, and HOW many times have I said: "Uh.. >I< dunno! Ask on c.s.a.8!" :))

Am I alone in this? How many others 'out there' have started correspondances with total strangers (I mean TOTAL.. people who've never or rarely posted before) because they 'picked' you out of the bunch...?

Just something I thought about last night for some reason.. thought I'd add bandwidth ;)

It probably has something the do with the fact that you're one of the
more prolific (or maybe THE most prolific) poster here, giving you
visibility and recognition, PLUS, you seem to be fairly knowledgable.
For the most part, it seems that those more knowledgable than you
don't post as much.

>Am I alone in this? How many others 'out there' have started correspondances

On other groups I've had brief correspondences like that, because of
something specific I posted, but I don't think I've had any thing
quite like you're describing.

4195. Progress report: Atari "Pocket" Reference

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-26 00:52:04 UTC
From: rfunk@magnus.acs.ohio-state.edu
Message-ID: <311mnk$csq@charm.magnus.acs.ohio-state.edu>
Source record: 99421

Just wanted to let everyone know that I really did start typing the
ANALOG pocket reference. I'm adding and clarifying things, so this
one will be bigger and better than the original. (But that will also
make my progress a bit slower.)
So far I have the Basic commands and functions entered, and most XIO
commands (still need the MYDOS ones).

I'm trying to include things not only from Atari DOS (like the
original), but also MYDOS, SpartaDOS 2.3/3.2, and SpartaDOS X.
I'm also going to add to the memory map. The one in the original was
inadequate, in my opinion. Any special requests? (I'm not going to
put the entire Mapping The Atari in, just a few brief highlights.)

I should have it done in a week. Hopefully.

It's 0:33 AM and I'm actually replying to KENDRICK@SONOMA.EDU's message!

K>I'm wondering what really good, FAST replacement routines there are for
K>the
K>Atari's plot/drawto routines? I'm sure I could write something myself
K>in
K>Action! (for example) but the only plot routine I know is pretty slow
K>in itself
K>and even compiled would probably go slower than the ROM's routines.

The ones in the XL/XE OS are awfully fast. It would be hard to write
faster routines in ML, let alone Action!

If you want to speed up graphics routines, don't use PLOT or DRAWTO at
all. Lay out your screen memory ahead of time and display it all at
once by switching to/addresses in a display list. The main slowdown is
in calculating memory location and bit layout in PLOT and calculating
the delta in DRAWTO. Don't make it calculate, and you don't have
slowdowns.

GMS>commented source code then somebody could go in and do a housecleaning of
GMS>the banked ram and disk routines so that we'd have a 4 megabyte LINEAR
GMS>transparently banking word processor and a 4 megabyte compatible
GMS>Spreadsheet both compatible with hard drives.

Neat idea, Glenn. Too bad there isn't a standard (not even a NEWELL
standard) for everything between 128K and 4 Meg. Maybe if you offered a
menu, or had a REALLY good checking routine to determine which bits were
for RAM and which were for other things. And then there's possible
conflicts with Ramdisks and SDX....

Quoting the inspirational words of KENDRICK@SONOMA.EDU:

K>Mapping uses "above" and "below" a lot, but I'm not sure whether "above"
K>means
K>"locations with larger (higher) values" or the opposite!

K>Can someone help me?

This should be in the FAQ. The lower the address, the lower the memory.
The higher the address, the higher the memory.

K>Now.. how do I go about finding what "MYSETx"s should equal!?
K>I did this:
K> BYTE FRE=106
K> ...
K> MYSET1=FRE-16 (and -20, and -24, and -30, and so on)
K> MYSET2=MYSET1-4 (4 pages=1k, so in essence the first font in RAM is

Correct, basically. Try it like this:

```
BYTE RamTop=106
..
RamTop==-16
Graphics(0)
Myset1=RamTop
Myset2=RamTop+4
;etc.
```

Always do a Graphics(x) call after changing RAMTOP. This moves the
display list and screen RAM above the new high pointer. That way your
data won't interfere with the screen or vice-versa. (The Graphics 0
screen is always around 1K under RAMTOP.)

K>Also, At the moment, I'm using MOVEBLOCK() calls in my VBI.. stupid, huh?
K>I think using CARD movement should speed that up (and shrink it!), no?

Uh, yeah. Don't use any library routines in your VBI. Make your VBI's
as tight and self-contained as possible.

K>HELP ME! I'VE CALLED A VBI AND I CAN'T TURN IT OFF!

See previous post. Chest pains or someone outside your window are other
problems. (Old joke)

---
* QMPro 1.52 * It is hard to believe that even his friends like him.

4200. Re: turning off VBI's

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-26 01:00:25 UTC
From: pab@cnx.sccsi.com
Message-ID: <cfb_9407260315@cnx.com>
Source record: 99452

And now, listen to the writings of KENDRICK@SONOMA.EDU:

K>Finally, what's wrong with doing this for the VBLANK routine:?

K>PROC VBLANK=$0600()

K>which replaces the generic, "it goes where the compiler sticks it":

This tells Action! that there is a routine at $600 that it should JSR to
when a VBLANK() statement appears.

K>Since Action! can't take more than 8 parameters to a PROC or FUNC, I'm
K>supposing the reason they said 'byte' and not 'parameter' is so that you
K>can
K>stick stuff together into cards which'll let you pass more than 8
K>bytes.
K>(Or perhaps even a byte or array?)

Action! places your arguments as needed based upon their declarations.
If your original declaration was:

PROC MyStuff(BYTE x,x1,x2,x3, CARD xc, BYTE y,z, CARD yc)

And you passed:

MyStuff(10,11,12,13,14,15,16,17)

The argument stack would look like this:

A 10
X 11
Y 12
$A4 13
$A5 0
$A6 14
$A7 15
$A8 16
$A9 0
$AA 17

Note that where a BYTE value is being passed, it takes up a single byte.
CARDS are stored in LSB/MSB order.

K>Anyways, can't SETVBV(7,VBLANK) replace SETVBV(7,VBLANK/256,VBLANK&255)
K>or
K>are the bytes backwards? (X=low, Y=high, does just using "VBLANK" as a
K>card
K>stick the wrong values into X and Y ?)

No, it would store them correctly (i.e.: the way you want them). Your example above (VBLANK/256, VBLANK &255) is doing it backwards. x/256 gives the MOST significant byte.

Rob.. check out the MyDOS docs for XIO command DETAILS (which work under Sparta also, etc).. here's MY list..

(I have some references which list fun POKE / PEEK locations, the musical note SOUND pitches, disk stuff, fun USR() calls in BASIC, etc.)

13 STATUS request
32 Rename
33 Delet
34 Make dir (MyDOS, I think Sparta too??)
35 lock file
36 unlock file
39,40 load (if aux1=4 then run.. if aux1=5 then load)
41 change dir (MyDOS, see above)
253 Format single (DOS 2.5)
254 Format (DOS 2.0 = single, DOS 2.5 = enhanced, MyDOS = single or set density. Aux1(I think)=1 for enhanced in MyDOS)

OPEN modes:

4 read
6 directory
7 directory input (DOS 2.5 only is what I have down.. I have NO idea what it is.. I forgot! :))
8 open for write
9 open for append write
12 read/write mode
13 concurrent (R: handlers)

that good enuf for now!? :)

> (feb6399@ultb.isc.rit.edu)

> (yup, still .sig-less.... one of these days....)

I uploaded the file "siocopy.zip" to umich but I have not been able to get back on (to umich) to verify the location of the program.

I would have perferred to use the serial port on the IBM, but adding rs232 drivers and getting the serial com. chip to "lock" onto the Atari SIO data rate added some complexity that I did not want to deal with.

The clock signals (pins 1 and 2) are not used by Atari for anything (as far as I know). I used the following pins:

data in pin 3
gnd pin 4
data out pin 5
gnd pin 6
cmd/ pin 7
rdy pin 10

Pin 10 (rdy) must have a logic high. Some peripherals draw power from this pin, but luckily the disk drive does not.

The critical timing appears to be between the lowering of the command line (pin 7) and the start of serial data (I used ~1msec). The time from the end of serial data to raising the command line is not as critical. The serial data rate only needs to be close to 19000 bits per second (note that 19200 bps did not work.)

I hope this helps

Mike Munoz

4204. Unfinshed Emulator Source (was: Re: XF2's graphics.. but how!?)

> > documention does not necessarily reflect the current program.)

:I like to see your assembler source code, but I'm also interested in your first
:attempt trying c++ for emulator development.
:Your updated documentation is highly appreciated.

:Ralf Blume

I have received enough requests that I will upload both the c++ source
code and the assembler source code for my atari emulator onto 'umich'
as soon as I update the documentation (in about a week).

I must apologize, I had planned on updating the documentation sooner
but instead I wound up finishing all of the graphics modes and adding
player graphics. I was in the middle of trying to figure out the
best way to do collision detection when I came to my senses. This
emulator stuff is very addictive.

Also a note of caution, I will not upload the Atari ROM code. SO
if you want to run the emulator, you will have to dump your
Atari 400/800 ROMs (800xl,1200xl,130xe ROMs cannot be used as
written) in Atari 2.0 DOS format in a file called Atari.rom.
(If the Atari ROMS are no longer copyrighted, let me know.)

Couldn't one of the translators (especially the official Atari disk
and the ANALOG "Homemade Translator") be used for this somehow?
Setting up the ANALOG translator involved copying the ROM from an 800
to the disk.

Speaking of TextPRO and 80 columns, I'd had the chance to have lunch with
Ronnie several months ago and at that time he'd said he didn't think it
would be too hard to make TP XEP80 compatable... With Mike H. coming out with
his 80col card from the MIO, maybe I need to nudge Ronnie to make an XEP
version.

RE: FlickerTerm as a text processor...on my mono Magnvox it looks fantastic!
on my 1702, the flicker drives my up the wall.

Write Ronnie and tell him you want an 80 col version...he needs to hear from
more than just two or three people.

Why do you want to use an address other than $E453 for SIO?
Mydos version 4.50 and later have an ascii "M" in the first byte of the
first sector. This byte is "S" for Spartados disks and $00 in most oter
disk operating systems.
In the flag byte for each directory entry, one of the bits (I forget
which one) tells whether the links are Atari style (file number plus
10-bit link) or Mydos style (no file number, 16-bit link).
Directories are still 8 sectors long in double density. Only the first
128 bytes of each directory sector are used.

Well, I downloaded all Mike's newly uploaded goodies.
It turns out that you need to run SHELLGX even if you are using
3.2g and not 3.2gx version of SpartaDOS from FTE.

Kudos to FTE for making the CD, RD, and MD commands in 3.2g to match those
in SD-X. Now if I'd only quit confusing the Unix equivalent commands with
those of SpartaDOS!!

Although I got Flickerterm's flicker to a tolerable even on this cheapo
RCA black and white monitor designed for closed circuit cameras,
the character set is too hard to read: the letters are all mashed into
each other.
I think this can be solved with a little editing of the character set.
I also plan on hooking this up to my Goldstar greenscreen and see how
that changes things. I have noticed a difference with ICE-t, and maybe
it will make a difference with this flickerterm also.
By the way, has anyone gotten it to work with SpartaDOS-X?
It crashed on me, using an Rverter. I'm running Flickerterm under SpartaDOS
3.2g now.

An 80 column version of Textpro would REALLY be nice, especially with all the
new featues that have been added to it.
80 columns would make it one of the most usable word processors for the 8 bit
machine.

I still find myself running Turboword (bleah) just for the 80 columns used
by the XEP80. I think screen updates with the XEP80 and Textpro would make
it kinda slow, unless somebody can figure out how Atari custom wrote
their Atariwriter 80 driver to work so quickly with the XEP80 device.
I don't even think EMAX, which was written to take special advantage of the
"high speed modem" in the standard XEP80 handler updates as quickly as
Atariwriter 80 does.

I'll be waiting anxiously to see what comes of the FTE MIO/80 column
card project for sure!

4213. What is the best GFX on 8-bit?

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-26 08:56:59 UTC
From: bryedewa@news.delphi.com
Message-ID: <312j4r$6l5@news.delphi.com>
Source record: 99435

I was wondering... for all those who view pictures on the 800/XL/XE, what is the best display method known of to date? I know of COLORVIEW's 80x192 with 4096 colors, but has anyone beat that yet? I was curious about messing with display methods and wanted to know where I should start.

-Bry

4214. 2 thumbs up for Flick80

Message-ID: <312oor$nud@usenet.INS.CWRU.Edu>
Source record: 99436

HI All,

Just tried Flick80 last night ... very impressive. It is easy
to see how it got its name on a regular TV, but on a 1702
monitor, the output is GREAT. At least this prgm. works with
my system .. still haven't been able to get Ice-T to work
with SpartaDos. I await the release of the final version,
as this version cannot upload...

Good Job!!!

Bill

: all say 1200XL? Also, HOW CAN I RAISE $210 quick?!?!?!?!?!?!

: -Bry

I think the 1400XL may have referred to a machine with only the speech and no modem and drives. The 1450 may have meant the modem add-on. My board says 1450 too but I still call it a 1400 because 1450 connotes drives even without a D.

G. Mayner (gmayner@access.digex.net) wrote:
: For future reference if someone is giving something away I suggest those
: interested include their phone number or physical address rather than
: simply continuing to post E-Mail with more and more questions.

I don't know anything about this message, but here is a few points, whether
you are giving it away or not, to help you sell it:

1. Expect people to ask questions, you would get less if you give more details.
2. Expect people outside of your own town to be interested, offer shipping
(COD) at the buyer's cost.

: For the guy who sent his address and offer to send a check for shipping:
: It'll be there soon!

So you did sell it, and now your happy and someone else is happy.

I have bought and sold alot of stuff on different networks, and experience
has taught me that you need details, details, and details. But then again
if your selling a whole system for $50 then what do you expect for the seller?

I would buy an entire system for $50, the drive is worth nearly that much and
I could easily make a quick profit.

Don't take this as offense, I was trying to help, but you already sold it. :)

4222. Info about the 850-Interface required

Source record: 99453

I have an ATR 8500 (never released new version of the ATR 8000) free to a good home. All I ask is $10 to cover shipping costs and packing materials. It includes the motherboard, power supplies (2), cables, manuals, and software (CP/M and the ROM source code). It does _not_ include the board necessary to connect it to an Atari, nor does it include a case.

I am hoping it will go to someone who has the time and knowledge to make use of it.

Reply by e-mail to ccastn1@oit.gatech.edu

!??!?!?! The OS plot/draw routines are FAST ENOUGH!?

I BEG TO DIFFER! They've been called all sorts of names by lots of people ;)
but I dont believe 'fast enough' was ever one of them (until now)..

The OS routines are coded so that they can draw in any mode, from 0 to 15..
it'd be much more efficient (so far as SPEED vs. memory) to code a routine
for all 16 modes.. but they did it the other way 'round because of memory
contraints.. (thank god :) .. until now.. when speed would be nice :))

Source record: 99456

:)

And this time I know what I'm doing .. sorta :)

I'm just curious.. where's a good place to store parameters?
I'm having a little trouble with page 4 but I think that's the Action!
compiler's fault. Also, page 6 is a nice place.. but everyone ELSE uses it
too.. either for temporary storage or other things.. I MAY use it just
because few corruptable things are placed there (DLI's, VBI's, etc) and even
if a program overwrites (temporarily) page 6, it doesn't matter because it's
only used once between programs (the CLI writes, the executable program
reads)

For NOW, I'm just using D9: RAMdisk for the CLI.COM program (which will become
DUP.SYS) and for the parameters (stored in a file called "PARAMS.DAT"..
lame, I know.. but it works, and it's by no means permanent!)

Since my only other WORKING CLI was COM_RUN, do any of you out there who had
experience with that bit of code have any suggestions or comments I should
hear now!? :) (COM_RUN is available via FTP at UMich.. I forget where.
It's either COM_RUN.ARC (perhaps two ARCs?) or COMRUN.ARC (no underscore)
and requires TurboBASIC XL and prefers MyDOS)

Thanx in advance!
Wish me luck! hehe

Bounty Bob Strikes Back is a case in point. It is BANKED ROM. YOu can't emulate Banked ROM easily in RAM. With an emulator you have a chance, but you still have to read off the banked ROM and mimick the banking logic in the cart board. Many XEGS carts use banked ROMs. Like Flight Simulator (I know it's also on disk). We got away from 8 and 16K linear ROMs in the mid '80s dude.

Need I bring up SDX into the discussion? I suppose that doesn't count since that is a "serious application" and emulation almost certainly means nothing but game duty so things like that are useless in that environment.

They ARE mashed together. How else do you get 4 bits? I hope you don't intend on redefining the set to 3 bits. That would be a waste. 3 bit SUUUUCCCCKKKKSSS!!!!!!!!!!! They ARE mashed but they don't bleed together as far as I'm concerned due to the fact that one is decaying while the other is brightest so they are at equal brightness over the boundary only for a tiny fraction of a fraction of a second. If you saw the same font in Gr.8 it would be MUCH more mashed-looking.

I don't know why Flick might not like SDX. I suggest mailing clay at:

E.HALLIWELL@genie.geis.com

with your bug report and he can work it out.

Source record: 99464

Well, I am slowly working on a memory configuration add on for Textpro
5.2. The way I've planned it will work is this:

First, if you use a RAMDISK, be sure your Ramdisk is EMPTY before running
Textpro and the configuration module.

The module will ask you to enter the drive number of the Ramdisk.
It will open a file called "Dn:junk.txt" for write, and
keep dumping a certain byte into that file, until a disk full error
is returned from CIOV.

Once that is done, the program starts banking, looking for banks which
don't contain that data byte. If it finds them, it considers them untouched
by the RAMDISK, and thus free for use by Textpro.
The banking routine will assume that the OSROM enable bit is still used
for the OS ROM, and that the CPU enable banking bit is still used to
enable banking. All other bits will be twiddled. This will allow the
program to search through a maximum 64 banks looking for free ones.
The free ones will be saved as part of the TOOLS or BANKUTIL addins
so that you can then use those add-ins to configure Textpro for
from 1 to 64 banks of extended memory.

Hi, all.

I am looking for ATARI's hardware manual now. Is there
hardware manual(s)?? On AMIGA world, there are many document for
hardware. If someone have such a document, let me know.

I think "memory map" and simple BIOS informations are
written on its manuals, but if we hit hardware directly, we need
hardware docs. Please let me know. But don't show me true BOOKs.
I can't get it, I think. I can get data from only UMICH.

Thanks for your reading. Mails are welcome. :)

Way off subject here, but the absolute *dumbest* thing about Streamliner
is that all I/O is done a byte at a time, instead of huge blocks. I did
it that way 'cause I liked to watch the numbers increase.

I have tried to shift a GTIA mode over 1 clock (HSCROL is supposed to
add a delay of x clocks to a scan) but the pixel boundaries stay put.
Is this my fault or are GTIA modes confined to even scroll values?

j >It crashed on me, using an Rverter. I'm running Flickerterm under SpartaDOS
j >3.2g now.

You need to have SDX in osrom mode, not banked mode. In banked mode it
seems to load one half of the screen then quit. Can't really talk about
the Rverter, never having used FlickerTerm with an SX212 or the
Rverter cable itself. Still, if it works with SpartaDOS 3.2g (it does for
me as well) then once SDX is in osrom mode, it will work there as well.

Hope this helps anyone else who's had similar problems.

>Maybe It's this monitor.

I've been running FlickerTerm 80 under SDX. I already forget whether it needed "use banked" or "use osram," but for me it definitely made a difference.

I do agree that Ice-T is more readable than Flick80, but of course they're both much better than the old gr.8 method.

All of my usage is on an 80 column mono monitor.

Question: Why should this be the case for any programs? I can see where
"use osram" would cause conflicts with software that needs that space, but
why should something like FlickerTerm 80 care if SDX is using the first
bank beyond 64K (which is what "use banked" is supposed to do)?

From the manual:

"Alternately it can use the last bank of XE RAM if it detects SpartaDOS
in use."

This was a patch he added later and I think he didn't work it out totally.

It reports a message on initialization that it is using the "last XE
BANK" when you load it in Sparta 3.2. It just won't run right afterwards.

It would be no surprise for anything that uses the under the OS RAM to run
under SDX with use banked. TBXL does. I don't have SDX right now, I'm
waiting for the update so I can use it with my MUX. I have the MUX
disabled because I'm waiting for the R:P: so I can get high speed off the
SIO since I don't want to waste the BB as a file server. I'm using the
BB port now. As you can see, this "waiting for" chain makes me not a
happy camper at all. I was actually running a BBS before I had to take
it down so I could dial out personally at high speed.

4258. MARS8 speculation

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-28 00:46:26 UTC
From: krishna@max.tiac.net
Message-ID: <316v52$cgb@sundog.tiac.net>
Source record: 99486

I've been bullish on FTE for a while, but I'd like to add a shot of realism to this discussion. Or, more to the point, I'd like to illustrate a few points about the 8-bit userbase which I feel are significant when speculating where MARS8 is going to go.

Fact:

Most die-hard 8-bitters who have been in it for a while and are into the nitty gritty already own most OSS/ICD carts.

They also probably have manual RAM upgrades of various types.

Conclusion:

Buying into a $250 (fully loaded) MARS8 which merely repackages things they already have and offers a few subtle enhancements is a hard sell to the die hard who has it all.

It is also a hard sell due to cost-benefit analysis across platforms for what $250 in computer buying power can get you.

Note:

I'm sure other stuff is planned for MARS8. It's more than the sum of its parts, however, the fact remains that it will be a hard sell at that price range. If I had no OSS carts it might make sense, but the redundancy of the purchase is a real curse in my case. I have a 3 language switcher. (I also have the originals from which this was made, it was put into the original BXE cart board by Barry Gordon). I recently purchased another R-8. I could get a Newell upgrade for a meg or so for less than $100 and save myself $150.

I'm not saying that FTE should take a bath and sell MARS8 for nothing, but I think they should explore something like maybe accepting trade-ins of separate OSS carts as credit for MARS8. If I could get $100 in tradein credit for my 3 carts and R-8 ($17, $17, $17, $50) and ordered a machine with only 256 of non battery backed up RAM for $125 then it would be within my threshold.

8-bitters like me have ICD stuff coming out of their ears. Unless trade-in deals can be arranged, then I don't see people shelling out big bucks for MARS8. As much as I want it, I have come to the conclusion that I will not (I can't actually) get it unless I get a trade in credit to make it affordable. If I had $250 to blow on computer equipment I'd be much better rewarded by another platform where a bunch of 16-bit applications would open up to me whereas MARS8, at first glance, does not add much functionality to those already used to banked RAM and the like.

Remember when I was talking about the cheap and simple conversion board idea for the '802? To me, that is what the 8-bit needs. Cost-benefit anal. is really running against FTE products these days. I mean, when it comes to CSSware, half of the hardware I've got, modem, drives, etc.. could be reused for another platform. The SIMMS in MARS8 might be portable but that would be about it.

I am just saddened that the march of technology is pressing the need for ever more elaborate hardware enhancements to the Atari, but at the same time, in 9 years of existence, banked ram utilities are woefully limited and there are far too few serious programs which know what Sparta or a hard drive is. It's putting the cart before the horse. Most of us have jumped on the banked RAM bandwagon and have seen something less than a worthy catalog of programs to get the most out of it. To expect the userbase to shell out hundreds for hardware and gamble that software will use it is a hard sell.

I think what the Atari 8-bitters need is software. I know, 8-bitters are thieves and pirates and it is hard to make money making software. But still, the need is there. I know FTE has programmers working with them, but we need more than just revisions of DOSs and languages. We need overhauls of existing programs like Textpro (or Paperclip if it is legal [and Syncalc]) for 80 collumn and invisible<<<< banking and Syncalc.

I think Ben had the right idea when he had the balls to try to snag the rights to TurboFile.

Ok, I don't know what our (the 8-bit community's) "Dream Street" looks like nowadays, but I MUST agree fully with Glenn when he says we need:

A better word processor than TextPro (when it comes to banked RAM)
(and the 40 column restraints)
More programs which aren't restricted to the old "one or two drives and
48 or 64k of RAM" restraints.. we need software which will handle
any number and size of drives (THIS in fact should have LITTLE to do
with the actual software out there.. this should have to do with ONLY
the DOS.. but NOO!.. look at AtariWriter+ (the unpatched version), it
supports D1: and D2: and that's IT.. it can't be (easily?) booted off
of a hard drive or under any DOS except Atari DOS 2.5!)

Well, ok :) I dunno if those are Glenn's EXACT feelings, but it's what I thought of when I was reading his post and some mail he sent me which was more or less like his post but much longer and more detailed. (and which I got interrupted while reading twice! argh! hehehe)

-bill

I got a copy of a hacked AW+ with some of the used stuff I bought once and I just got so frustrated trying to work with it. Remember, it IS a boot disk (which I hate). I suppose they were trying to make it more convenient but it's a major kludge as it is now.

And I know AW+ a LOT better than I know TextPRO. In fact, on almost every point, I prefer AW+. The commands are very intuitive with AW+. The text movement and scrolling is VERY fast with it compared to TEXTPRO. It can change collumns for a scrolling 40 collumn window which I use a LOT for manually making tables formatted for 80 collumns. This feature pretty much makes 80 collumns unnecessary for me. I have a copy of AW 80 which I never use. It's the linear banking of PaperClip that should be adapted to other WPs. PC stores text very differently from other WPs. I think it stores it a block at a time or something. PaperClip and Basic XE are the 2 most progressive uses of Banked RAM ever designed for the Atari and unforunately they were not followed with other programs which acted similarly.

I also like the way AW+ formats things. I had a HELL of a time trying to write a script on it though because there are no macros. I had to change the line spacing every time I went from dialogue to description. It's also hard to get a bibliography formatted right. With the screwy reverse "outdenting". So you never get everything :(

I've got a copy of Paperclip without dox so I can't comment on its overall functionality. It's got a lot of features (looked at online help) but is lacking in a few areas. No macros for the most part for one thing. I don't know what it has for a print-preview.

Another thing I hate about TP is the way it treats ATASCII characters. I mean, I do like being able to do it at all. It isn't easy with Atariwriter where those characters are formating commands. But the whole "command mode off/on" toggle is a bitch to work with. Maybe if he made it so with command mode off, SHIFT CONTROL commands (ala Flick) could move the cursor and control delete would remove text, then there would be a way to fix typos when doing ATASCII other than toggling and trying to remember whethe it is in "command mode" or not :/ Not to mention taking

over one of the ATASCII characters (Null I think) for the visible return. Visible returns aren't really that necessary, and if you REALLY needed them you could cut up a PMG for em (since you'd never have more than one on the same scanline) and keep the font intact.

When I was editing a screen for my BBS, I had to just "remember" that I put a heart in there because it doesn't show up. I suppose I could have loaded another character set and all that BS.

Actually, if I remember, the left-arrow was turned into the Carriage Return character... Yeah, the TextPro font usage is a little tweaky, but >I< do happen to prefer the easy of ATASCII use in it over AtariWriter+. I shelled out $50 for AW+ and got the versions of TP I got for $0..

<sigh>

I dunno!

: and Ice-T sure ain't Gr.0. I haven't seen it yet myself, though I'd like to.
:
:
I think he meant the way VT100 and omnicom and Kermit65 worked.
See, ice-t gets a dramatic speed increase because in order to scroll
the screen due t a line feed, instead of moving the whole 8K of screen RAM,
ICE-T merely updates the display list pointers, and has to alter one
line (40 bytes) of display RAM to display the new line.

I believe the older Vt100 80 column programs just kludged along,
trying to move the whole screen ram area when a linefeed scroll was
required, which caused loss of characters above 1200 or 2400baud.
ICE-T is very readable, even on this RCA video monitor, and looks very
nice on my Goldstar green screen mono monitor and Supervideo 2.1 in the
800XL.

I wonder how ICE-T and Flickerterm 80 would compare on a TTL monitor
using the AC TTL upgrade?

: an Atari directly connected to a BlackBox or something?

About 90% as fast as a direct connection. Not that perceptively slower.

At least not in my experience.

Hey, anyone wanna try to tackle a rewrite of the MUX OS/Master.COM to be able to swap partitions from a slave?

I don't think this update is gonna happen anytime soon from CSS (hasn't been a single upgrade in 4 years) so maybe if someone expressed interest and felt they could do it they could convince Bob to give the OK.

There is going to be a muxable SDX, and high speed modems off SIO, so that is 2 out of 3 in the "MUX wishlist".

: Then send a letter to Ronnie and TELL him, the more folks he hear's from
: the better... As far as he knows, there are only like 5 Atari folk left!

He kinda bugs me. YOu see, he keeps on saying "this is going to be the
last version" then he keeps on working on it. At this point I thought he
was done with it. The idea that he'd be open to an extensive hack for 80
collumn seems unlikely from what he's expressed before. It's been what,
a year since 5.0x came out? His promises do not mean much. He had drive
trouble and it took him months to get help? I would have gladly sent him
a 1050. Does he live in a cave or something?

Ronnie made 2 mistakes when he wrote Textpro:

1) He used the speedscript core:

Slow memory management/text scrolling problem.

2) He chose the "islands of text" banking scheme:

Should have ripped off Paperclip XE.

Therefore when it comes to my 2 biggest pet peeves, the only way to fix
it is a complete overhaul. Not likely. 80 collumn is probably doable,
but I don't hold out much hope that he can possibly squeeze in advanced
banking routines.

So I'll take whatever he comes up with but I won't whine to him asking
for the impossible.

4274. The Atari 14xx Series

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-28 06:15:10 UTC
From: b.poehland@genie.geis.com
Message-ID: <199407280614.AA013366080@relay2.geis.com>
Source record: 99501

The 1450XLD is *extremely* rare. There apparently was actually a production run of them, of which roughly a dozen were shipped to Atari from the Taiwan factory for final debugging & for photo/promotional purposes. The rest were never delivered, for reasons that have such a wide variety of explanations no one is sure what version to believe.

The 1400XL & the 1450XLD were prominently featured in Atari Corp.'s slick full-color 1983 product catalog. The speech processor was supposedly accessible either thru BASIC or thru a built-in text-to-speech converter. Same with the XLD. But no one is around any more who knows how to access the speech chip. Same for the modem, the 1983 catalog claims the modem is accessible via built-in modem software. Dunno if that means just a handler or a full-fledged program. Perhaps some combination of special function keys activated these special doodads. Both machines featured a PBI. The only difference between them I can see is that the XLD came with the fancy case & dual DS/DD built-in floppies. That XLD was sure one sexy-looking thing. <drool>

Of course, the Atari catalog also states the 14xx machines "estimated availability" by October 1983. Sheesh! It was the only the beginning of a long string of baloney to emanate from Sunnyvale....

I know how.
Open #1,8,0,"VS:"

? #1"test"

Something like that. There is a text file floating around on how to use
the chip in Basic. But once you play with it you will discover it is
limited because:

A) no speed or pitch changes possible

B) ties up basic during talking.

I know B) is a function of Basic, not the chip. It multitasks during
self-test. A) I have no idea whether it can be altered, but somehow I
doubt it.

In a message dated 7-26-94, Scott T. Traynor said:

"...is Bob Puff still around?"

Yes. From what I understand, the next Atari 8-bit creation we will see from him will be the R:P: interface, for 38.4Kbps serial communication.

"Is there a source for 8 bit hardware anymore?"

Depends on what you are looking for. A vendor list is frequently posted here which is a good resource. As far as power supplies, Best Electronics, B&C Computervisions, American Techna-Vision or even Toad Computers (they do Atari 8-bit stuff too) would be good bets. Of course, for many items, including power supplies, buying used from a fellow Atarian (or even someone leaving the flock) gives you the best bang for the buck.

"(Who remembers those Amdek's? dualies? :))"

I remember 'em...never had one, but I remember 'em. <grin>

I even have some magazines old enough to have the big full page ad on the back cover for them. <grin>

In fact, someone was selling an Amdek setup here on c.s.a.8 within the past week.

: b.poehland@genie.geis.com wrote:
: : Same with the XLD. But no one is around any more who knows how to access
: : the speech chip. Same for the modem, the 1983 catalog claims the modem is

The 1983 Issue (one of them) of COMPUTE! where they advertised
the new Atari Products has a few paragraphs about accessing the speech
chip. It is via the V: device...however there are different ways
of talking with it... via Phenonyms and direct text. i.e. "Atari" or
"Uh-tar-e." It is closely related to the Vox? Voice chip box for the
old 800...except as I recall not all the functions of the chip were
wired up in the 14xx.

The modem is the T: device.... (and it reminds me all TOO closely
to a 1030 Modem.)

All of this is supposed to be or is NOT supposed to be in the roms...
and NOT the os rom... or maybe it is... (notice the ambiguities in that
statement... I have had claims that the os does/doesnt control these
devices.) Atari themselves stated that they were "supposed" to be bus
devices. ahahaha... I take that with a grain of salt. Of course...
they could be... and if they are TRUE bus devices...following all
their own specifications (atari's that is) then building a bus
speach/modem/floppy device should be simple... you just need the
roms. (Of which I have most on file) =) hehhe

Of course... wouldn't hooking an MIO up to the 14xx cause nasty havick
since the MIO likes to take up all the bus devices?

Anyways...

What I wouldn't give for a 1450 case!!! screw the boards.... just the
case would be nice... I would jam that thing full in hours! Hmmm...
wonder where the molds.... someone want to fly to Tiawan?
Or, I wonder if someone would donate a 1450 case (temporarily of course)
to someone like...maybe FTE... so as to make a limited case run... =)
Of course I don't think Atari would like that...but tough cookies on that
one. I would buy 8 cases right now.... even if they were $50 a piece.
(of course you would see 1200xl's wanted to buy adds everywhere...
which reminds me... I have to work on hooking that keyboard up to
the other xl's. And they say it can't be done....ahahahahah you should
see what can be done in a University lab late at night with some caffeine.)

And no one has come foward with a theory on the 1250XLD nameplate..
oh.. and what does a 1200 Case look like anyways? (Not xl)

Dare to dream....

I wonder if I couldnt rig a 1450 case up with some 1050 cases and
a 1200xl. hmmm....

Andrew

4280. Flicker80

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-28 15:11:27 UTC

Message-ID: <318hqv$oe@usenet.INS.CWRU.Edu>
Source record: 99358

For those that have been "non-plussed" by the output of Flickerterm80, try diddling with the screen color or luminance. I found that when using a TV, it was best with a dark (grn) background, and white text. It was top notch on the C-1702 monitor, and the ANSI graphics were swell.

STILL haven't gotten Ice-T to work with SpartaDos 3.2g/MIO. Might have to talk to Mike at FTE to see what the SpartaX Cart cost.

ttfn .... Bill

4281. Newbie needs Help!

Hello to my fellow users of the World's Greatest 8-Bit computer ever!

* I needs some help!

1) If and when I ever get to the ftp site (or its mirrors) how do I navigate? (Yeah I know, broad question, but I'm a new driver on the Info Highway :]) I'd like to pick up the UUde/code stuff.

2) I see also that there are new(!!) 8-bit programs (flick80, PABQWK 2.0 (I could never get 1.0 to work for me :[) I presume that these are also available at a ftp site? (My local bbs are all ST/PC/MAC)

3) I had to bring my 800 out of retirement as my 130Xe just up and died! :(and I'm using Kermit 3.1 now on a service that is linked to the internet. Does anyone have any idea of how to capture text direct through the Kermit program (Otherwise I have to reboot with Bobterm and do straight captures that way. The other way is to save the files/articles to a file and then still reboot/load to capture it)

Any assistance would be greatly appreciated. Thank you. Oh, just in case the mail is still under contstruction at my site my address is dlfurman@dorsai.dorsai.org.

1) Unless the OS is REALLY weird on the 1400xl/1450xld, then "V:" should
suffice. (It's like opening "Editor:" or "E:ditor" or "K:eyboard", etc)

2) Hey, why not try poking and proding at the "V:" handler via XIO calls!

Also, isn't there an easy way to look for installed devices on the 8bit?
(Other than a FOR loop going from "A" to "Z" :) hehe.. although that'd work
just fine, I'm sure. :) All non-errors would signify an existing handler.)
Just look into memory at the handler table, right? Can't you from there
look for the V: handler's code and then disassmble it!?

SOMEBODY GET TO IT! Hehe.. it sounds intriguing! :)

-bill
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu

Message-ID: <940728113607.24009690@sonoma.edu>
Source record: 99364

Ok... a week or so ago, I carefully walked into the comp.sys.cbm area, no knowing if C= users still 'hated' us Atari 8-bit users, or whatever (I was never around during this 'Great War' .. I was at home chugging away in Atari BASIC oblivious to all of the other Atari 8-bit and Commodore 64 users).

ANYWAYS.. I asked what all can Commodores do, and it's pretty impressive. Although better and worse in some ways than the Atari, I'd average them out to be at least CLOSE to even nowadays... (Of course, an IBM is BETTER than an Atari, but that doesn't mean it's nice to use.. same goes for the Commodore.. last I remember, they were a little .. dreary.. but that's just my opinion, and this was back in the mid 1980's)

Well.. the thread has gone on for a while, people asking back and forth, and some of the C= users even answering some of the questions Re: Atari's that the other C= users asked...

but NOW.. I've seen three posts, and gotten one mail in the span of less than 24 hours which pretty much say they're "sick" of hearing about it.

Screw them! It's just the same damned thing as the "I hate the emulator!" complaints. USE A KILL FILE. DON'T READ THOSE MESSAGES. Sheesh.. besides, just as the emulator discussion at least PARTLY belongs here, the comparison between Commodores and Ataris belongs either there or here... and seeing as I was the one who started it, and my question as to "What can the Commodore do?" should be directed to C= users rather than /|\ users, I picked the C= group to ask on. They had no problem until today/last night.

Pretty strange huh? I guess I'm just bitching (it's rubbing off my mom >:^( ) so I'll shut up now, but have any of you others gone into the realm of the .cbm group? I know Itay did, which piqued my interest in it, but he only seemed to find triva questions, whereas I found typical posts like I'm used to seeing here (except without the emulator posts here and there)...

grumble

Glenn,

Well, first off, that language switcher sounds very interesting.
I'd like to see a schematic or something if you could come up with one.

But onto the Mars-8 and Banked Ram discussion.

First, the mars-8 is also going to include a 65816 on the board.
I believe that was announced a couple of weeks ago.
That itself could improve the performance of things like Textpro,
because an Add-in module will be able to patch the old block memory move
routines with the new 65816 memory move opcodes to speed things up.
That's been hashed over by John Harris.

Textpro's banked ram scheme isn't that hard to live with.
One of the print controls allows linking between banks, so that a
document crossing several banks still prints as one document.
There are already macros to automatically load and save a large document
which occupies several banks. The only thing missing is a way to re-spread
out the document text throughout several banks when one particular bank
becomes full, ala Atariwriter 80. Once that's done, shouldn't be too hard
as an add-in, Textpro will at least have the banked Ram usability of
Atariwriter 80.

There are other advantages to separated banks, like working on multiple
documents.
Lord knows how much I've appreciated fine tuning Macros like the letter
automation macro, where the letter to be written resides in bank 1,
a database of people's addresses resides in bank 2, and the actual
macro which I'm working on resides in bank 3.

Okay, yeah, Paperclip is still alot easier to manage in the Banked ram
area, but it's marco functions leave something to be desired,and Textpro's
ability to continually redefine print keys makes handling a LARGE number
of different printer control commands much easier. And that was certainly
the case with me when I was taking heavy advantage of the various
point sizes and printer fonts built into the epson Stylus 800 to
print Resumes.

When I was working on the Expanded Ram series in Atari Classics for my
Moonlight workshop column, I actually discovered quite a few expanded RAM
programs. unfortunately, the majority of these were Ramdisk drivers.
Many more were file or sector based disk copy programs.
I agree with Glenn that despite the length of time that Expanded RAM
has been around, Expanded RAM software still appears to be in its infancy.
I'm Pessimistic however, that this will ever be remedied.

There just aren't the programmers anymore.
hardware people still hang around because it's still fun and easy
to hack stuff onto the Atari 8 bit.
Bob Woolley is still fooling around with the hardware aspects of IDE
as far as I know. Michael St. Pierre is working on a Genlock board.
Bob Puff is doing the R:P: interface, and FTE is doing all sorts of
interesting stuff. On the software side, it's more difficult to
come up with new stuff. To break out of the current generation of
applications means adding some serious sophistication, which is
difficult with today's programming tools, especially in the aread of
programming for the dreaded Banked RAM area.
It HAS gotten better though. There IS a series of routins for
CC65 with at least takes advante of the 64K of 130Xe banked ram to
use as variable and data space.

Then a few months ago there was posted some methods which allow
Action! code to be stored in various banks of RAM and jumped into from
the main program code.
The ratio of hardware to software development still seems to be off balance
though. I don't know if things will ever improve.

> Is there any vector other than $E453 to JSR with the proper data
> on page 3 ($300-...) ? The location depends on the version of MyDOS?

This looks like a job for "Mapping the Atari". You can actually
jump to DSKINI for many disk operations. Using the SIO vector directly
can be quite tricky, but can be done... though I find little need, unless
you plan on writing your own drivers. The location should be independent
of the DOS you are using since these are OS functions.

> Also, what I have to do to recognize a disk to be in MyDOS format?
> A flag in some sector? 360? How can I know the sector size before
> reading?

ASAIK, the MyDOS format is VERY similar to AtariDOS 2.5; just a 'superset'.
I.e., If you format a disk in single or enhanced density under MyDOS, DOS 2.5
should have no problems, providing that you don't use any subdirectories.
I could check the tech. docs to be see if there is a flag somewhere.

re: Sector size. When you do a device status for a drive the status bytes
(I think there are four), return various info. These bytes are located
somewhere below $300... I can't remember. Anyway, a bit set here shows
the disk is DD. I *think* it the first unused bit in the status register,
according to "Mapping...". (you must, of course, have just performed a disk
read operation and no other device operation before checking this byte.)

I've written code to return the sector size, free sectors, and aprox. free
bytes using the above method. It works under AtariDOS, MyDOS, and SpartaDOS.
I could post (it's short) or e-mail you a copy if you like.

> One more. A double density disk has only 4 sectors for the main
> directory (and each subdir) ???

I'm not sure what you are asking.

> Quite hard questions, I know... ;-)

Two resources that are a must. "Mapping the Atari - XL/XE version" and the
tech specs for the DOS you use. The Mydos info is probably in at umich.
I would actually pay good money (if I had it :) for *GOOD* SpartaDOS X
tech specs.

Speaking of specs:
Does anyone know about the relocatable handler loader in the XL/XE OS? The
US+ OS has eliminiated this code due to lack of use, but I would really
like more info. Seems like yet another Atari feature that was never taken
advantage of, due to poor info.

> Thanks... Bye... ++Vitoco

No, problem. If my had my "Mapping..." here, I could give you more detail.

4290. Atari 8-bit Newbie / Stupid Question / Emulator help FAQ! Rev.0.3 (2nd time)

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-28 20:45:18 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940728134505.240085b8@sonoma.edu>
Source record: 99368
Cross-posted to: comp.emulators.misc,comp.sys.atari.8bit

Here (for the second time) is the 0.3 revision of the Atari 8bit Newbie FAQ.
Crossposted to both comp.emulators.misc and comp.sys.atari.8bit because it
deals with questions from BOTH groups, not just 'how do you use the PC XFormer'
(which would keep it in c.e.m) or just 'how do I use Atari BASIC?' (which
would keep it in c.s.a.8)...

[follows is rev.0.3 of the Atari 8bit newbie/emulator faq:]

```

The Unofficial Atari 8bit ||||
Newbie / Stupid Question / Emulator Help _||||_
FAQ `\\ //'
`\/'
```

By Bill Kendrick
Revision 0.3 !! PLEASE !!
July 23, 1994 ASK MORE QUESTIONS

Differences from Rev.0.2: Added where to get (FTP) mentioned files,
e-mail and postal mail contact addresses, removed bad (space-wasting)
formatting in the "XIO" section, did minor editing here and there.
PLEASE also refer to: MyDOS 4.5 documents, SIO2PC documents,
XF2 documents, and the Atari 8-bit F.A.Q.

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file:
From: Michael Current <MCURRENT@carleton.edu>
Where to get the latest copy of the Atari 8-Bit Computers
Frequently Asked Questions List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto::mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/faq
quit

Finally, you can always ask Michael for a copy at
mailto::mcurrent@carleton.edu

Objective of this file:
Much discussion has gone on in the comp.sys.atari.8bit Usenet
newsgroup about the newly released (mid 1994) Atari 8bit emulator for
IBM / MSDOS based computers, the PC X-Former 2.0 (XF2 for short). Many

people in the 8-bit community have gotten, well, fed up with the XF2-based questions which do not pertain to them, or to the really dumb questions which are in fact understandable to new or rusty Atari 8-bit users, but have just gotten on the nerves of some of the comp.sys.atari.8bit readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2 questions.
This FAQ will present answers to simple questions like "how do I turn off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL) and "how do I get a disk directory?" (which is less obvious on Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari 8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a suplement for the many official and unofficial files floating around the net (like the official FAQ, the Vendor/Developer List, the Who's Who list, etc.).

---=== XF2 Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may require the XL/XE Operating System (which XF2 does not emulate).
A.2.2) Be sure you turned BASIC off before trying to load it if it cannot run with BASIC on.
A.2.3) It may just refuse to run on the XF2 emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note: on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported on the XF2.
A.4.2) (See Question 2).

Q.5) How do I exit XF2 and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS parameter after the "XF2" command. (DOS25.XFD and MYDOS45.ATR are both DOS boot-disk-images and are both in the XF2.ZIP file).

Q.7) How do I use MSDOS files with XF2?
A.7.1) Add the files to the command line and use them as their respective drives (be sure the first drive is a DOS-bootable disk image).
Example: XF2 MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS

4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XF2 which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XF2 from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XF2. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XF2 and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the XF2
(and the S2PC program mentioned above). .XFD files are used by
ST X-Former (the Atari 8-bit emulator for Atari ST's) and
PC X-Former (XF2).

Q.9) What's SIO2PC?
A.9.1) Refer to the XF2 and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XF2 does) as a single file all alone in
its own disk. It also currently allows Print-Thru (all access to the
Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.50 (because these topics seem the most
relevant to the less-knowledged/experienced XF2 users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or

disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XF2, it's much quicker to just copy one .XFD or .ATR to
another).
[K]
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they

aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)
disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,

etc.!
After the "D:" device name comes the filename. Of the most used DOSes, only MyDOS supports lowercase letters in filenames, but since most programs force uppercase entry for filenames, nobody really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu interface. When it asks for a source and destination, you can use wildcards (* and ? like in most other DOSes) to copy more than one file at a time. You can also present no destination so that a file can be copied from one disk in drive 1 to another disk in drive 1, for example, and the DOS will ask you to insert each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the normal directory of a disk, except the they happen to be WITHIN that normal directory, or even another subdirectory. For example, you can have your disk divided up into the "GAMES" files, the "GRAPHICS" files and the "SOUNDS" files. A directory of the disk (the "root" or "base" or "trunk" directory) will simply list the three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then, if you ask for a directory listing of the "GAMES" subdirectory, you will see the files (and perhaps other subdirectories) within the "GAMES" directory. Think of it as a tree. For people familiar with Macintoshes, "Folders" are simply subdirectories. A window which appears when you open a "Disk" Icon is the "root", and all of the "Folders" within it have more windows in them which also have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes are not necessarily using drive 1, and MyDOS and SpartaDOS may already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current' or 'default' directory to a different place (a different drive or a subdirectory). "D:" can stand for "D1:" (like AtariDOS always does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory, files, multiple devices (up to 9 on MyDOS and newer SpartaDOS,

8 on AtariDOS)
E: editior - readable, writeable. This is how input from the
keyboard and output to the screen is normally handled. If
you wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
K: keyboard - readable. This is just the keyboard. Input from
it is not 'echoed' back like with the "E:ditor".
P: printer - writeable. Send data to this and it will appear
on the printer. You can print files (documents, etc.) by
using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional

start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo) BASIC's commands and their usage. (A larger file may be produced which will be based on examples provided in the Atari BASIC Reference Manual). (As of today, 7/23/94, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines (Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP] to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XF2 users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings are special character arrays. See the BASIC usage/etc. files mentioned in the answer to question 2. Simply put, to make a string that will accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2 sized text covering the bottom of the screen. Add "16" to the mode number to remove this window (but do not make any PRINTs or PUTs to the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing when it appears. One problem, however, all screens overlay each other so unless you only use certain modes at certain times, parts of some screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics include:

PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XF2 doesn't support sound! But, anyways, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop

ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the characters plus 128. (The only non-viewable inverse character is inverse-ESC, or what would be the [ESC],[RETURN] combination. The character exists, but must be set into screen RAM by hand. Oh well, at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them. When simply entering text, type [ESC] then the edit key and the character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an ESC beforehand, so first type [ESC],[ESC] to make an ESCape character appear, then type [ESC] then the edit key and the character for that edit key should appear. When the PRINT statement is executed, the first ESCape (which you typed as two [ESC]'s) will make the editor SHOW the following character (even if it is an edit character), then the character which you entered (with [ESC] and then the edit key) will make that character appear. This makes it difficult to align a set of PRINT statements which make a multi-line picture or menu which uses viewed edit keys. It is probably best to have all of the lines in your program with the PRINT statements that can fit visible on the screen, then edit them (without putting any of the ESCape characters in, then when the picture looks like how you want it on the screen, move the cursor to on top of each edit-key character and press [Control]+[>] (Control-Insert). A blank space should appear under the cursor and the rest of the line should move right. Now, type [ESC],[ESC] and an ESCape edit-key character should appear where the blank space was. When you are finished doing that for each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1" to turn on the no-edit mode (ALL characters except End Of Lines will appear, even ClearScreens!) When you want to go back into normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called "Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE series (and probably on the 5200 and 7800 but I cannot confirm this). When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc) minutes, the screen colors begin changing, thus protecting your TV or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the command "POKE 77,0" at least once every few minutes (IF the screen is active, otherwise turning it off would be kinda useless).

To turn it on, wait 7 or 9 minutes without pressing a key or having
location "77" set to "0", or set location "77" to "128" with
"POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file

(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari

8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
board or account you have access to, and then connect the modem
to your IBM and download the files.

---=== Where to FTP files mentioned in this FAQ: ===---
The PC X-Former can be downloaded from the "ftp.clark.net" FTP site:
Directory/file-path: systems/msdos/emulators/xf2.zip
The following programs are availabel at the "archive.umich.edu" FTP site:
SIO2PC: atari/8bit/sio2pc/*.* [all files are SIO2PC/utility files]
MULE: atari/8bit/Utilities/????
Util: atari/8bit/Utilities/????

: >7 directory input (DOS 2.5 only is what I have down.. I have NO idea what
it
: > is.. I forgot! :))

: Never heard of this one. I'll look in my books for it. Don't see how
: it could differ from 6..... unless... maybe it reads the whole
: directory on an enhanced density disk, rather than just the first
: half.

That one I believe was used under DOS 2.5 to read the directory enties which
were contained within the disk space readable only under 2.5's enhanced
density. Remember that DOS 2.0S could see the files that were stored under
the portion of DOS which included 2.0 (the first 720 sectors I bekieve) but
files stored in the enhanced portion of the disk could not be seen by 2.0. 2.
5 showed this by placing <> around the name of an enhanced density file.

: : : Same with the XLD. But no one is around any more who knows how to access
: : : the speech chip. Same for the modem, the 1983 catalog claims the modem is

:
: The 1983 Issue (one of them) of COMPUTE! where they advertised
: the new Atari Products has a few paragraphs about accessing the speech
: chip. It is via the V: device...however there are different ways
: of talking with it... via Phenonyms and direct text. i.e. "Atari" or
: "Uh-tar-e." It is closely related to the Vox? Voice chip box for the
: old 800...except as I recall not all the functions of the chip were
: wired up in the 14xx.

You are referring the Alien Voice Box, a SIO device. That one has
additional circuitry to interface with he Votrax SC-01 to add more
pitch/speed variances (thus it can sing). I doubt the 1400XL can do the
same, but our info on the chip is limited to what you can do in Basic. I
tried sending all sorts of strings but it doesn't seem to react to them
the way, say, SAM does, for inflection.

: All of this is supposed to be or is NOT supposed to be in the roms...
: and NOT the os rom... or maybe it is... (notice the ambiguities in that

The OS ROM in the 1400XL is identical to the XL/XEs. When I put a MUX OS
in it still talks. The hook for the self-test talking and the drivers
are stored elsewhere, perhaps on the SC-01 or some other place. The
SC-01 itself in my machine apears to be an EPROM, it has a sicker over it
like an EPROM.

: statement... I have had claims that the os does/doesnt control these
: devices.) Atari themselves stated that they were "supposed" to be bus
: devices. ahahaha... I take that with a grain of salt. Of course...
: they could be... and if they are TRUE bus devices...following all
: their own specifications (atari's that is) then building a bus
: speach/modem/floppy device should be simple... you just need the
: roms. (Of which I have most on file) =) hehhe

Bob Puff has had some hacking time by now on my 1400XL and a couple
others. He himelf told me that the speech and modem ARE PBI DEVICES. No
question about it.

: I wonder if I couldnt rig a 1450 case up with some 1050 cases and
: a 1200xl. hmmm....

I put my 1400XL board into a 1200XL case. It fits well as long as you
cut for the straight joysick ports and the extra ports on the back and

stuff. My board (and probably others designated 1450 like mine) have a 34-pin ribbon cable connector right under the PBI. Guess what this is for? Yes, it's for the FDC daughterboard. Definitely some hacking potential there.

4293. Re: C=64 people are weird

C= people are sensitive because in order to get good performance they have to pay big bucks for both an interface and a PROPRIETARY hard drive. Whereas we can use off the shelf drives at a fraction of the cost.

C= can do better ANSI emulations (especially the 128). The 128 is a machine I do respect. Hardware 80 collumns, a Z80 for built in CP/M fun and games. But the difficulty in getting into the hard drive arena is by far their biggest problem. Not to mention the DOS ON THE DRIVE problem. Obviously they mostly use a replacement DOS rather than the regular crappy one. Novaterm for the most part blows Bobterm away from what I hear. Everything is in it.

However, the extra RAM in the C= is rarely if EVER used for anything but a ramdisk. With the Atari although this is a problem, there are a FEW programs that make good use of banked RAM. Not really so with the C=. Their REU cartridges are little more than ramdrives.

Also, their numbers must be thinning a LOT because there has been various emulators for it on the Amiga and other platforms I think. It's certainly a lot cheaper to run stuff off the hard drive of an emulator (if that is possible on those emulators) than to go to the extreme efforts to make the drives on the 64 or 128 fast enough. As for floppies, CMD did come out with high density drives, even up beyond 2 megabyte using an oddball scheme I think. C= themselves did officially release a 3.5" drive for the 8-bits if you can believe it.

: Mark Perry
: mperry@cairo.anu.edu.au

I believe that you have the same cable that I do. Audio/Video to the atari
5pin monitor connector...This is what I did: Took apart the connector that
goes into the atari (without breaking it), there was a black plastic strip
around the three pins that are wired up. When you have the connector
facing you, there should be two pins outside of the plastic. Now, take the
plastic off and sauder the pin that was not connected on the RIGHT side to
the pin to the RIGHT of it. What you're doing here is connecting Luminance
and chroma (I believe thats what it was). That should give you color. Put
the plastic back and put the connector back together...

4296. A problem with Sparta 3.2g

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-28 23:39:27 UTC
From: jjmcwill@next5
Message-ID: <319fjf$lc9@mtu.edu>
Source record: 99373

If you have a stock Atari XF551, or one with the Bob Woolley version
of the 720K controller ROM, then you're aware that these don't support
true Ultraspeed. In order for SpartaDOS 3.2d to use the high speed mode
of the Atari XF551, a patch program was written which patched X32D.DOS
to use the Xf551 high speed mode.

Unfortunately, this patch does NOT work with SpartaDOS 3.2g.

Bummer, I really like this version of the DOS.
Does anyone have an idea how to fix this? John Harris, are you out there?

Jeff McWilliams

I think each screen line is stored separately, which is why your text
disappears if you change the number of columns from, say, 80, to 40.

>I've got a copy of Paperclip without dox so I can't comment on its
>overall functionality. It's got a lot of features (looked at online

>thing. I don't know what it has for a print-preview.

IMO, Paperclip is the BEST word processor for the Atari, especially
if you have over 64K.
If I remember right, PC's print-preview is similar to AW's. It isn't
as necessary in PC, though, since you can edit with horizontal
scrolling, either as a solid window or line-by-line (like Action).

Hey, you could use Zaphod as an inspiration whenever people here say
"Wow, are you really THE John Harris?"

"No, just _A_ John Harris. Haven't you I come in six-packs?"

Wait a minute... this is comp.sys.atari.8bit, not alt.fan.douglas-adams.

Well, the Assembler Editor cartridge is okay but MAC/65 is better.

Books? Hmm, if you can find Compute's "Machine Language for Beginners". That's a good place to start. Also, "The Atari Assembler". The authors were the Inmans (I believe). Another good book for the Assembler Editor.

Just a few ideas...

256K COMPLETE ATARI SYSTEM FOR SALE:

Atari 800XL with 256K RAM (Newell RAM upgrade), two (2) 1050

floppy disk drives, INDUS GT floppy drive w/carrying case, 850

serial and parallel interface, 1010 cassette drive, Commodore

1702 composite color monitor, misc. software (inluding

ATARIWRITER, ATARIWRITER+ and Atari Spell-Checker) and

magazines, plus all the items listed below:

1)Pilot Programming Language

w/"Turtle" graphics, (Educators'

package)

2)Conversational Italian (learn

Italian with your computer!)

3) Timewise (Time management)

4) "Kingdom" (Instructions and

game, cassette)

5) "Biorhythms", (Instructions and

game, cassette)

6) "Super-Text" word processor

(disk)

7) Atari BASIC Ver. C cartridge. Eliminates bugs in built-in BASIC.

8) RESET button, plugs into cartridge slot.

9) "SynsStock" (Stock charting)

10) "Sargon III" (Chess program)

11) Misc. downloaded software on disks.

12) "GO" (Ancient Japanese game, harder than Chess)

13) "The Newsroom"

14) "Movie Maker" (Animation Construction Set)

15) Batch of RAM chips removed when I upgraded to 256K.

16) "Proofreader" (Spelling Checker for Atariwriter)

17) "Your Personal Net Worth"

18) "Managing Your Stocks",

19) "Softporn Adventure"

20) "Pinball Construction Set"

21) "Personal Inventory Manager"

22) The following from XLEnt Software:

(A full desktop publishing sytem for the 8-bit Atari)

a)Megafont II

b)The First XLEnt Word Processor

c)Rubber Stamp

d)Typesetter

e)Page Designer

BOOKS:

Atari Programming with 35 Programs

An Atari in the Classroom

Your Atari Computer

TOTAL PRICE FOR THE COMPLETE 256K SYSTEM WITH MONITOR, 3 DISK DRIVES,

850 INTERFACE, CASSETTE DRIVE ALL CABLES AND THE SOFTWARE AND BOOKS

LISTED ABOVE: $299. PLUS SHIPPING, OR BEST OFFER.

Please reply by e-mail.

4303. Re: MARS8 speculation

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-29 01:59:51 UTC
From: krishna@max.tiac.net
Message-ID: <319nqn$b21@sundog.tiac.net>
Source record: 99381

Jeffrey J. McWilliams (jjmcwill@next5) wrote:
: Glenn,

: Well, first off, that language switcher sounds very interesting.
: I'd like to see a schematic or something if you could come up with one.

It's pretty simple. It isn't perfect, though. It doesn't react to OSS.COM quite as cleanly as a REAL supercart. It's been a while since I've used it a lot but I think it crashed when I tried using OSSCART to disable Action! and with my original cart it worked. Have to check it out some more. The price is right, though. Barry opened up his services to anyone interested but I think I was the only one who jumped at the offer and sent him the 3 carts w/$15 labor fee. In retrospect I kinda wish I had BXL instead of BXE. BXE is unique, but it is a kludge as far as interfacing with Sparta. (i.e. memory conflicts with Shell and 3.2gx and the dumb disk extension boot procedure as a whole). I'd love to replace my Rev C basic with BXL since it would fit in the same address space and be 100% compatible.

: But onto the Mars-8 and Banked Ram discussion.

: First, the mars-8 is also going to include a 65816 on the board.
: I believe that was announced a couple of weeks ago.

Yes, but as you recall, I started a thread months ago saying "why don't we write up a test file on a simple 65816 conversion board for the XL/XEs. It would probably cost less than $20 to make". Well, that would have taken off a lot faster than a $250 jobber. Noone will pay that much JUST for the exclusive 65816. And like I said, die hards probably already have banked ram and OSSCARTs up the yin yang. The only thing that really is exciting about MARS8 to me right now is the 65816 and what Mike might do with it in the future. Nothing else is GROUNDBREAKING. Sure, a daughterboard as MARS8 is, is a LOT more foolproof and cleaner to work with than a soldered mess of dead bugs. But I am doubtful that people will be willing to pay that much for that convenience. Although there are different flavors of MARS8 in the works, none of them really crosses the $100 barrier. In my case, I'd be perfectly happy with NOOO internal carts, 256K RAM, and that's it. I don't know how he plans on populating it, but it makes sense to sell it unpopulated if it will accept the cart EPROMs directly. Either that or a credit for the carts. He has to realize many die hards will wind up with totally redundant OSS carts as a result of getting MARS8. If I got credit for my carts and a more bare-bones unit it would be affordable to me.

: Then a few months ago there was posted some methods which allow
: Action! code to be stored in various banks of RAM and jumped into from

: the main program code.

Now this I'd like to see again. I've been discussing this lately with the PRO! people (like Tom Hunt) and the main obstacle is the fact that since you compile separately that the main program will know nothing about the baked ram areas so simple procedure calls will not work. The main program has no record of them, where they sit, etc. Then if you JMP or JSR into the bank, again, procedure calls to other bank routines would still be invisible to the main program. Extending the symbol table with a bunch of "equates" is what Tom Hunt was discussing (if I ready him correctly). It's a kludge but it might be workable.

Bill Kendrick and I were discussing how this might be fixed for a formal Action! XE update.

Essentially the only thing you are missing is global variables declared in the banks and procedure locations. You could still compile to separate banks as norma, but then use an off-the-shelf master banker/loader program and have some additional commands for the compiler to chew on to bring in the locations of the procedures in the banks and the global variables in the banks to put them into main memory so you can simply do standard procedure calls. Something like:

(please forgive any syntax errors)

CONFIGURE BANKING [01,0A,03,04] <-- assigns hex values to bank variables sequentially.

Bank_include (BYTE bank_number_variable,D:source_code.act)

This would chew on each program you feed it and expand the symbol table so you can call the procedures as if they were in main memory.

This main program would also automatically load the banked extensions on execution.

Although this solution involves revising the compiler, it MAY be possible to do something using some innovative hacks. For instance, Tom Hunt has a program that will scan a program and report where everything is located. If you used this program, then used a separate program to take the output of the text file and expand the symbol table manually, you could generate a manual table.

Obviously for large upgrades the table could get exteremely bloated, perhaps using the entire bank window in main memory would be advisable.

You could reserve a huge 16K code block and then include a program that would fill it with all the procedure names and address names. Then have a separate procedure that would call a bank and execute a given procedure:

```
type array p=[cli]
call_proc (p,param_1,param_2)
```

```
proc call_proc
get_bankval(p)
get_addr(p)
portb(bank_val)
jsr(address)
```

Something like that.

<yikes.. no normal good editor.. hmm>

Ok.. I found quite a few miscelanious WAV files on one of the binary newsgroups so I've been converting them with my slow little 8-bit -> 4-bit (Parrot file format) converted and then decided today that I need something better than that stupid, unuserfriendly Digiplay program I came up with in less than a minute in TurboBASIC XL. :) SOOO! I loaded up Digiplay and hacked away at it..

Now I've got a nice little menu-style sound 'viewer'. It presents the names of all of the ".DIG" files on the current drive/directory ("D:*.DIG" inother-words) and lets you use the cursor keys to select one and then play it in one of three rates. These are three rates which seem to be the most useful:
8 - sounds fine with all of the Mac Sound control-panel sounds I've CNVRT48'd
24 - seems the best for the big bunch of WAVs I picked up when they've been CNVRT48'd
54 - this is the standard Parrot speed (if you record sound with Parrot a (oops, "at") the default rate, this is what you use to play them back properly)

Anyways.. the ARC is DIGIMENU.ARC and includes:

DIGIMENU.TBS - TurboBASIC XL program (DIGIPLAY upgraded)
DIGIMENU.CTB - ready to be pumped into the TBXL "RUNTIME" package
DIGIPLAY.TBS - the old small DigiPlay (good to work off of I guess)
NLODPLAY.LST - What DigiPlay really IS.. this is the TurboBASIC XL version of Parrot's LOADPLAY.LST. DigiPlay was just this plus a set of INPUT and GET and EXEC's. :)
CNVRT48.TBS - not the fastest, but the only (relatively buggless) 8-bit to 4-bit sound converter for Atari 8bits. One day I'll make on in Action! which actually understands WAV, SND, and AU headers and maybe even can extract digital sounds from MODs, wouldn't THAT be nice!?!? :)
DIGIPLAY.DOC - docs.. there's a tidbit of help online for DIGIMENU.TBS.. DIGIPLAY on the otherhand doesn't even assume "D:" for you.

:)

Go get it when it gets moved from the UMich "New" directory.....

Message-ID: <940728225621.2400914b@sonoma.edu>
Source record: 99384

Whoa what a subject.. damn, the editor still isn't coming up.. wonder why.

ANYWAYS.......

I'd like to spend some of my time (when I get bored/frustrated with all other things I'm doing) doing what I've always wanted to do.. port (not literally.. but from scratch) Atari 2600 games over to the Atari XL/XEs... Games like Sky Diver (which I tried not-that-badly with Sky Diving but that was a player/missle-less Atari BASIC chunk of code from a few YEARS ago..) and Space Invaders (although I know we HAVE that.. but is it PD?! NOO!!) and SuperMan and the cool 2600 version of Defender and so on..

What >I< want from YOU folks is a list of games you'd really like to see remade onto the Ataris.. Now, these won't be beautiful 4096 color remakes or something. :) I'm going to try to keep them as 2600-ish as possible (just to have that feel) but also at least upgrade in the resolution department for some of the older stuff..

Also, as I said a hundred times over in all of my old-BASIC-releases I made a while ago, I'd like to reprogram those now that I have both more experience, help from OTHERs, and better languages..

So.. from what you've seen of both the old Atari 2600 games, some of my older (pre1993 or 1992) stuff and hell, even some of the REALLY old 400/800 games, what stuff would you like to see remade and with what extra features? Also, what old arcade games did you adore which just never made it to the 400/800/XL series?? And DON'T say Moral Kombat! Hell, who said we couldn't have that!? It's just.. who'd WANT IT!?!?!? (Although I've had this urge to make it.. ehh.. I dunno.. I need better sound routines like in MegaBlast, or even just Epyx's World Karate Championship)

>Hi!
>
> I really like this list, but there are several people missing.
> Never heard about Julien Reschke (Profibuch, SCSItools), Andreas
> Kromke (NVDI), Uwe Seimet (many interesting stuff), Wilfried Behne
> (NVDI) and many many more?
>
> Hey wake up, we have e-mail in Europe, too ;-)
>

Hey, if you Europeans want to be placed on this list, YOU have to do the
waking up!

Users will not be placed on the list unless the maintainer (myself)
receives e-mail from the person.

Why do I do this? I don't want to get bitched at by people because they
are on a Who's Who list when they want to remain as silent as possible.
Some people like it that their e-mail address isn't well-known.

Another reason is because ALL the people on the list KNOW that they are on
the list. If a situation would change concerning their status or e-mail
address, they realize they are on the list and contact me.

If you want to be placed on the Who's Who list then give me information about
yourself. If you want a favorite developer of yours to be placed on
this list, tell them so they can write me.

Well I can just give you all the peripherals that I know (by atari)...

These all use 9v AC:
400 Comp
800 Comp
1200xl Comp
1050 Disk drive
810 Disk Drive
850 Interface
1010 Cassette
1020 Plotter
I don't know about the other Atari printers...
Does the Xf551 use 9v AC?

These all use the big black Atari power supplies:
600XL
800XL
65XE and 65XE Game System
130XE

These have their own power supplies:
1030 modem
SX212 Modem
Is there anything else?

This is just stuff made by atari tho...

Hows about it everyone?

Should FTe drop the MARS 8 project?

Is a 65816 processor really worth the time and effort?

Is 4mb of memory support a waste due to lack of software?

Well it's just too damn bad. The MARS 8 will be released, the 65816 will be supported, and the 4mb of memory will be used A LOT...

Even if I'm the only person in the "galaxy" (pun intended) who has one, It will be the most expensive upgrade for any computer that I will have EVER purchased. And you know what?? It will be worth EVERY thousand that it's cost me...

Mike (FTe)

In regards to AW+ and its non-functionality under other dos's other than
2.5

Well, All I needed to get AW+ to work on sparta was copy the files
over to a double density sparta dos 3.2 disk. The copy protection
craps out on the 256byte sectors and lets you use it.

I also have a hacked version that is supposed to let you have a sparta
dos shell.. (doesnt work well... you lose everything...)
but it supports ram drives... etc...

As for the hd.... I used to run the original off of the hd...
as I recall I never had to deprogram the protection (easy as changing
2 bytes mind you) ... you could easily access subdirectorys by just
giving the prompt the old ">". The only problem as I recall was
how deep you could go since the input buffer was only so big. =)

How about the original 2600 Adventure game (complete with "secret" room...)?

And you have my vote for porting over the 2600 version of Space Invaders. Truly a classic!

Well, my favorite 2600 game was Air/Sea Battle. I think the Sears
version had a different title than the Atari Version. There were about
10 variations of planes vs ships, cannons vs planes, ships vs subs, etc.
There also were variations of a shooting gallery game as well.
My son and I used to play that cartridge for hours at a time, usually
with my losing. I always wondered how they managed to cram so many
variations of a game into one cartridge which probably was only 4 or 8K.

THe XF551 uses the standard 9vac power supply. I think the 1020 plotter
does too. I haven't used mine in a LOONNG time.

THe Xep80 also has a custom power supply, I think it would be the same one as
the SX212 has.

I've changed jobs (again) and am back on the csa8 feed (in case anyone is interested).

Yes, Bob Puff is still around doing 8-bit stuff.

There are lots of places that still sell 8-bit hardware and software. Michael Current keeps a list and so do I. I would suggest American TechnaVision, B&C Computer Visions or Best Electronics for your power supply. I think ATV is the cheapest, but I don't have my catalogs in front of me. (You might also try cracking it open and replacing the fuse. I do that every once and awhile.) If you send me private e-mail, I will send some addresses and phones. B&C recently changed addresses. (So did Bolt's Electronic Repair, Michael C.)

If anyone is interested in writing for the longest running (14 yrs), internationally distributed, US-produced Atari Magazine that still supports the Atari 8-bit, please drop me a line. I'm always looking for good writers.

I'm looking for more people to get on the 8-bit FidoNet echo, here in Los Angeles. (We finally got the bugs out and have a real feed finally!)

As much as I hate to rag, the 64 is fairly pathetic from a hardware stance.
If that machine didn't have those 4 color sprites, it would be darn near
useless. The fact that it couldn't auto-boot anything, or come up without
going through BASIC made it a royal pain in the a**. Also, the lack of a
real XY graphics mode complicated things further.

Yes, though it would help if software authors could be induced to
produce for it...

>Is 4mb of memory support a waste due to lack of software?

Seems along time ago I heard the same thing said about the Newell
1meg upgrade...So, Yes, provided the upgrade if fully doc'd so programers
can take advantage of the extra ram...or maybe something like a highmem.sys
/ QuarterDeck that would allow the 816 to "see" all available memory...but
then we've already touched on that one...

>Even if I'm the only person in the "galaxy" (pun intended) who has
>one, It will be the most expensive upgrade for any computer that I
>will have EVER purchased. And you know what?? It will be worth EVERY
>thousand that it's cost me...

BZZZZZTTT....Thankyou for playing! There will be at least two, maybe three
and if I recall rightly we're all named Mike...

Just my few cents...I don't find the cost of the Mars8 any more out of line
than I did $400 for a BB/FB even though I already had an MIO/ATR8000...

Software support is going to be the tough part...what we need are ideas on
how to go about getting people to once again produce for our platform...or
me must start working together to make what we need...In a way, FlickerTerm
is an example of just that...a lot of folks kicked in ideas and code to
help the project along.

It's not a flame, Mike. But sometimes economic realities come crashing down, and I personally can't throw all my cash at everything a developer comes up with, even though I'd surely like to if I had the luxury of doing so. I don't think I'm unique in this, which is why I made my concerns public.

Unfortunately I realize all too well how much of an impact I alone have in my 8-bit purchases because the fewer 8-bitters out there, the more each of us has to be aggressive about supporting developers, and more than once I've purchased something more out of a need to "donate" than because I NEEDED somthing. The Floppy Board was an example of this. I really don't NEED it. It's come in handy a few times but it isn't a necessity. Since I had bought all the rest of my CSS hardware used, I felt an obligation to buy something new. I bought the FB with a 1.44 meg drive from CSS.

When I was sent the first AC, I was not overly impressed, but I HAD to subscribe. When renewal time came along, I did not feel as though I was getting my money's worth compared to the halcyon days of 8-bit periodicals, but I still renewed.

I've regularly gotten items from B&C and others, like when B&C advertised that they had MIDITRACK III w/interface, I jumped at it despite a lack of experience or time with MIDI, and my only MIDI device is a drum machine.

But although MARS8 is cool, the pain involved in paying $175-$200 is not worth what it gives me that I don't already have. I can't speak for others but I'm sure others are in a similar situation.

:
: Mike (FTe)

You know, all you'd have to do to get more support for your hardware would be to state publically that you have people on the books to develop serious apps for the new hardware. I keep on harping on the lessons of the T816, but it's a lesson that needs to be learned. And Chuck DID get SOME software out. Hardware without software is of questionable value.

Even I would consider pulling out my piggy-bank if I had an indication that the exclusive features of MARS8 or your other future hardware was going to be taken-advantage of by a new generation of software.

There are already quite a few T816s sitting around as doorstops. They make great conversation-pieces but besides the specs on the hardware, what can you do with it? Software makes the difference between expensive doorstops and a wise investment in upgraded hardware.

What good are speech and modem PBI handlers if you don't have the
hardware inside a non-1400 series?

: what are the pinouts?? I would guess that these are just bus lines
: that would run to the required circuitry on the daughterboard...
: Anybody got one of these boards and wants to draw up some schematics?

Bob Puff has 1400 schematics. They varies from prototype to prototype
naturally. His are BIG poster-sized schematics. I asked for a copy but
he told me they were too bulky to photocopy. But Bob Woolley probably
has something.

: Also.. what drive was used in the 1450? It was a dual density
: double sided one?!? Double sided? oh yah.. as I recall it was
: drive 1 and drive 2 combined right?? ANd you could boot off your
: SIO drive if you wanted by booting the machine w/o a disk in....

I'm pretty sure that was only a function of the DOS, not the controller.
I betcha if you wrote another DOS for the 1450 you could make it do the
drives in a more standard DS fashion. However, it should be known that
from my knowledge, the 1450 drives were NOT double density. They were
ENHANCED density. Essentially a double sided 1050. I real Edsel design!

David Hunt (Shadow) says he has a set of leftover 1450 drives. If the
floppy daughterboard could be cloned then I could probably hook up his
drives to my 1400 and check it out. But I was thinking that one could
rig up something akin to the Floppy Board right off the 34 pin
connector. Or perhaps control the drives directly through software like
an Apple does (right?). I mean, 34 pin is the same as IBM drives.

The fact is, any 8-bit with a BB/FB and a 14.4 modem blows the shit out
of a 1450XLD. The only thing it REALLY has going for it is the speech
and after I figured out that I really couldn't alter the pitch, speed, or
multitask from Basic that lost its thrill pretty soon. Alien Voice Box

is a lot better.

Does anyone know if there are any speech chips still in production? The Cheep Talk chip is long gone, believe me, I've looked for them.

With all the talk of MARS8 and the ultimate 8-bits, a non-CPU-intensive speech solution would be part of the frosting, and Alien Voice Boxes are ultra-rare. Why not interfacing the TI chip? Wasn't that pretty good?

I've tried Bill's new WAV player. I do recommend it. It's very user-friendly. Just use the compiled version with the TBXL runtime and store it in your sounds subdirectory.

Eventually I'm hoping we can revive .QXL format and also be able to convert .WAV > .QXL or "meg XL" because there are a lot of LARGE .WAVs out there too. Parrot really doesn't give you much room.

FlickerTerm seems to be tempermental with MYDOS. This is ironic since Clay is a MYDOS-phile. But the memory structure of 4.50 is different from 4.53 and I think Clay uses 4.53. FlickerTerm can not detect carrier status on SXs and if you switch back and forth between Bob and Flick you'll have to deal with Flick resending the init string. This is something Clay has to fix eventually.

One thing that usually works if you have handler trouble with Flick is to load Bobterm, get online, then drop and switch over. Then you're already online so it should be foolproof.

(Just to mention, I saw everyone's posts so far on porting games.. looks like Adventure is the big winner.. too bad I never got to the secret room.. perhaps I'm going to have to make my own version.. it'll give me a chance to make it bigger. Also, maybe I'll have 2600 mode (solid graphics) and XL mode (detailed graphics) ??) (Don't expect it soon though ehheehhe)

Ok.. Just to let everyone know.. my software isn't a WAV player like Glenn said. TECHNICALLY, I guess it is because you can listen to WAVs with it, but that's a two-step process. :) (Like calling CSView a GIF viewer...)

Anyways.. it's a WAV (or other noncompressed 8-bit sound file) to DIG (which is uncompressed, formatted (Parrot style) 8-bit sound file) converter.

The user friendly program Glenn's talking about (thanks hehe) is DigiPlayMenu. BTW, I haven't tested it with more than 2 columns (less than 40) sound files. To see if my menuer worked right, I just made a BASIC program which created a set of empty .DIG files (A.DIG to Z.DIG) .. lucky I did this because when I wondered what would happen when I played a non-DIG file even though it claimed to be DIG, it died bigtime, hence the error trapping. <whew>

Anyways.. I'm babbling.. (and what's your name? <ba dum DUM>)

Bill Kendrick (kendrick@vax.sonoma.edu) writes:

>1) Unless the OS is REALLY weird on the 1400xl/1450xld, then "V:" should
> suffice. (It's like opening "Editor:" or "E:ditor" or "K:eyboard", etc)

Interesting side note: the device-identifying character ("E for Editor, K for Keyboard," etc.) does NOT have to be an UPPERCASE LETTER per se: it can be ANY single-byte (single-character) name, except hex 00 (control L, the "heart" character). The available Atari device-name space is thus 255 entries (hex 01 thru FF) rather than just 26 ("A" through "Z"). I once renamed the "E" device to the <control-T-or-"circle"-character> device by poking the appropriate character into the handler table (HATABS, address 794 decimal); let me tell you, the BASIC "OPEN" statements looked pretty damn strange in the program I wrote afterward... One potential use of this technique could be to write BASIC programs that would not operate unless you first loaded a binary file that patched the names of the standard devices to something customized.

>2) Hey, why not try poking and proding at the "V:" handler via XIO calls!

Another option, that which I would pursue if I were in possession of this V: handler: DISASSEMBLE the thing! Of course, it might be pretty hard to figure out what the code was actually accomplishing, unless one had an actual 1400-series machine on which to test the effects of delivering certain values to the speech hardware registers.

Assuming of course that the 1400-series speech capability WAS hardware. We're all assuming that it was, but is there any proof? Don't Ask Software had come out with "S.A.M. - the Software Automated Mouth" a while BEFORE the 1400 series was announced, if I remember correctly, and it wouldn't be TOTALLY out of the question for Atari to have acquired S.A.M., burned it into ROM, and hooked it into the 1400-series OS... It seems to me that with the number of unsubstantiatable rumors about the 1400-series machines, there's room for speculation.

>Also, isn't there an easy way to look for installed devices on the 8bit?
>(Other than a FOR loop going from "A" to "Z" :) hehe.. although that'd work
>just fine, I'm sure. :) All non-errors would signify an existing handler.)
>Just look into memory at the handler table, right? Can't you from there
>look for the V: handler's code and then disassmble it!?

Exactly. The following one-liner (potential entry in the "immediate-mode utilities" contest) will show you the one-letter "device name" and the handler vector table addresses of all "installed" devices on the 8bit:

```
FOR A=794 TO 831 STEP 3:PRINT CHR$(PEEK(A));": ";PEEK(A+1)+256*PEEK(A+2):
NEXT A
```

>SOMEBODY GET TO IT! Hehe.. it sounds intriguing! :)

Somebody send me a 14xx and I'll attend to it. :-)

Bill,

I downloaded your DIGIMENU package and I really like it.
Please rewrite the converter in Action! The speed improvement would
REALLY help. I've been converting Montey Python and the hold Grail
samples upwards of 90K, and they take a really long time in Turbobasic.
Also, your screen flickers different colors when it's converting.
How about just turning off DMA altogether to get a speed increase.

Secondly,

I got a file which I converted called "peril", where Lancelot is dragging
Sir Gawain away from the "Grail Castle" in "Holy Grail", and saying it's
too perilous for him to stay. Only, it's about 65K, and DIGIMENU maxes out
at 29K. Darn. You thinking of adding expanded memory support or something?

The holy grail samples sound great... lots better than the James Brown
stuff you uploaded and stuff... really quite clean which surprised me.

Keep up the good work Bill.

Jeff

It is hardware. It uses the Votrax SC-01. Says so in the Best catalog
and says so on the chip itself. When you remove the chip, memlo is
restored by 512 bytes so I think the V: and maybe also the T: handler are
integrated onto the VLSI of the SC-01. Or perhaps the electronic logic
checks for the presence of the chip to determine whether it loads
the handler from wherever. There is no other obvious EPROM anywhere on
the board to supply the small handler. It certainly isn't in the OS ROM
(where you'd think it would be) And it is a good thing it ISN'T in the
OS ROM.

(to explain WHY, let's go back in time a little)

The original damage to the board was done by me experimenting with power
supplies. It uses a +12 line for the drives. It needs this line whether
you have drives or not. The DIN is the same as the 800XL but the
signals are different.

I sent it to Bob, he fixed it and gave me the huge brick to power it. I
then started having some flakies with the MUX OS at first which made me
think it WAS in the OS ROM. Turns out I had the modem card plugged in
backwards which blew a LOT of stuff on the board, hence the trip to Bob
Puff for extensive surgery. It was then (I was in Florida) that I called
him and found out that the PBI was nonfunctional due to incompatible
prototype design and there was nothing Bob could do to MAKE it compatible.
"It's too complex to explain, but I tried" is a paraphrase of what he
said. This was a big let-down, not to mention the seeming limitations on
the speech chp. He did find the board an interesting learning experience

as it was different from other 1400s (other ones with FUNCTIONAL PBIs). He didn't believe me when I told him it said 1450 on the board either until he saw it. I'm not sure if I plugged the modem in (and I don't know which way it plugs in still) whether it would work or if there are blown chips on that too. There are only a few chips on the modem board anyway, but it isn't worth risking to play with it.

When you run self-test, it says "Atari self test, press select, start, or reset". It multitasks this voice generation. The reason I say "multitask" is because:

A) The scree is not disabled

B) The keyboard is open for input, the self test code is running at the same time as the speech generation. You can JUMP QUICKLY to the POKEY test and it will play POKEY SOUND simultaneously with it talking!

C) If you are in Basic you can do a 4 voice chord and have it talk over it. Basic won't let you multitask, but since POKEY sound, by its nature, is generated constantly via the custom chip, and so is the voice, the result will be 4 sound voices and the speech over it. I suppose if you run code via interrupts you'd get multitasking with the chip, I dunno.

Note> The SC-01 DOES NOT sound like SAM. It sounds a LOT like the voice of the mainframe in WARGAMES. If it errors on part of the text you send it it will freeze on the tone it was generating. It does sound kinda pokeyish, but not pokey in "push the speaker mode" but rather in regular tone generation mode. It probably simply generates tones and applies a filter to it akin to the filtering one's voice and throat does. Analog synthesizers do this, and the goofy singing in part of the ClockWork Orange soundtrack use an acoustic voice synthesizer (I think) that mimicks the voice box with various bellows and you press the note and the phoneme. It's the same concept, only electronic. The 1400's voice is pitched as a slghtly reedy male (like in Wargames).

: Exactly. The following one-liner (potential entry in the "immediate-mode
: utilities" contest) will show you the one-letter "device name" and the
: handler vector table addresses of all "installed" devices on the 8bit:

```
: FOR A=794 TO 831 STEP 3:PRINT CHR$(PEEK(A));": ";PEEK(A+1)+256*PEEK(A+2):
: NEXT A
```

: Somebody send me a 14xx and I'll attend to it. :-)

I'm not really using mine at all, and noone has agreed to buy it, so I'll lend you mine if you want to look at it. The modem was removed but the speech is fine on it. (IMO the modem isn't even worth tinkering on this high speed day and age).

Let me know.

I'm not quite sure whether you'd accomplish anything PRODUCTIVE fooling with it. If you could find out how to multitask the chip like self test (probably requiring ML) that would make the chip useful for personal

programming projects whereas the only benefit it has over SAM when in Basic at this point is that it doesn't blank the screen or use up any Pokey channels. It still hogs the Basic interpreter when it's talking. If you could get it to change speed and pitch then I'd really be happy! I mean, it really would have only taken a few timer/logic chips around the speech chip to give it this functionality. In fact, the SC-01 has several options BUILT IN. Like I think 8 pitch variances or something. And maybe some speed too. Creative Computing had a write-up on the chip and its uses in several speech boxes that came out for the Atari and other 8-bits in the early '80s.

Also, if you come away with more info on speech chips maybe you'd be interested in developing a cheep-talk-like board (that is, if there are any good commonly available speech chips left around). I know if I poked my head into the TI newsgroup I could probably find a source for TI speech chips. And Best wants $15 I think for 1400 SC-01s {I don't think their stock will be depleted anytime soon ;^)}. As I said, I don't know whether these are STOCK Votrax chips or if they've got all this extra code junk in them. They may not be suitable for a hackjob based on studying Votrax specs.

I think the main reason I am acting under the assumtion you can't change pitch and speed is that indeed the chip seems to be a PERIPHERAL and not a truly mapped in coprocessor. It has to be TALKED TO through the PBI and the V: handler as opposed to poking an location it or the OS looks to. Since I've sent every conceivable text through and haven't been able to kick it into any other modes I figure that you CAN'T DO IT. I haven't tried XIO's, though. It would indeed be stupid for Atari not to allow manipulation of the onboard facilities for pitch and speed let alone adding the trivial amount of circuitry to expand it even more. I have rumors of Speech demo software SINGING on the 1400 but I have not been able to get this software. Again, this is a result of the dubious rumor-mongering of David Hunt aka Shadow, someone whom I used to "believe" religiously, hence my handle "Krishna" dubbed onto me by a PRO! sysop in my local area who at the time was flaming me for being so gullible. I have since wised up (a little at least), but my handle remains :^P

Well, agreed, I goofed. But in a way I'm right because all the sounds
_I_ have were converted .WAVs anyway, not generated from the parrot
interface directly.

And I still have yet to see an .RGB image that was created by an Atari
paint program. Just converted .GIFs. I haven't even seen one generated by
ComputerEyes (but I know it can and will be done -- by me!).

Speech is right in the range that the Atari can handle. I believe the
Atari's sample/playback rate is almost identical to that of standard
telephone lines. It sucks for wide-tonal-range stuff but works for mid
range stuff with a compressed dynamic range.

Like .GIF conversion, some things work, some things not so well. If by
some chance the result of the conversion is a .DIG file that has to be
played at a very high rate, you can try cutting out every other byte in
the .WAV before conversion so that it will play twice as fast and
therefore be playable at a slower rate. So far I haven't found a sample
at such a speed to allow this, but theoretically you might be able to
fudge the conversion to maximize quality by getting it into a format
where it has to play it at full speed (no delay) and thus best quality.
I mean, playing back a sample on the Atari at anything besides the
maximum speed the Atari can spit out is kinda a waste.

Of course, memory was the reason for playing it slower. However,
Megablast for instance, reserves an entire 64K to samples. Obviously it
is trying to play them back at the maximum rate.

Tom Hunt wrote the .QX 256K format. I will try to get him to write out a
tech file on it so that Bill and others can build on his work. These
days, QXL is a little limiting. Supporting 512K and 1 megabyte is worth
it IMO. It does take a while to load a 256K sample though, even off the

hard drive!

Jeff (McWilliams), yeah, the Convert4/8 code REALLY needs to be ported to Action! but I never got off my ass to do it. Also, don't bother trying to run it in compiled TurboBASIC XL because it sits there going through the file but results in a 0-byte (I think) long DIG file.. it's crazy. Like I said, TXBL's compiler and runtime package are buggy.. >:^(

As for playing sounds over 29k, well, there's DigiPlay (the crappy player) which is very very small and I believe determines how big a file can be depending on FRE(0). Theoretically, you could probably get nearly 40k.. maybe shrink down the DIMmed strings (they're 120 bytes because that's how much the E:ditor allows, and also because there's a chance one might need a long path for MyDOS or something) and stuff.. I dunno.

What I'm interested in is a revision of the Parrot QXL format (currently it records about 1:10 (over 200k) max, but not only MAX, but ALWAYS.. if I stop recording after say 50k, it still plays back ALL 200k and still saves ALL 200k! Also, you can't change the recording rate, only the playback, and also I've not seen any documents on the file format or player code (which has to be a bit different than normal Parrot's)). That'll break the 20-30k barrier really nicely. :)

Finally, re: your Holy Grail sounds (send 'em to me hehe) sounding a lot better than, say, my James Brown digi demo, well, of COURSE! They weren't recorded on a Parrot! And probably weren't recorded via crappy cables from a tape player like the James Brown samples! :) Also, the code which calls the player routine is in TBXL, so there's much bigger gaps between samples (at least when playing at different rates.. ie, I could play samples 1,2,3 and 4 all in one USR() call as long as I want them at the same speed! :)). FINALLY, notice how in DigiMenu, you get three choices for playback speeds? 8=Mac, 24=IBM(Wav) 54=Atari(Dig) ?? Well, notice the HUGE step from 8 and 24 all the way up to 54? That's because it's playing less data for the same amount of time, hence the bigger (slower) number. You could theoretically cut out overy other nybble from a Mac sound then play it half as fast and get the same sound (not as GOOD, of course) but it's not easy to go the other way! :) (ie, make a file bigger and more detailed.. what are you going to work off of? Well? I guess a good smart algorythm!? hehe!)

Ok.. I'll be quiet now.. I'm glad you like (and esp. that you get USE out of) my programs...!

: Speech is right in the range that the Atari can handle. I believe the
: Atari's sample/playback rate is almost identical to that of standard
: telephone lines. It sucks for wide-tonal-range stuff but works for mid
: range stuff with a compressed dynamic range.
:
: Like .GIF conversion, some things work, some things not so well. If by
: some chance the result of the conversion is a .DIG file that has to be
: played at a very high rate, you can try cutting out every other byte in
: the .WAV before conversion so that it will play twice as fast and
: therefore be playable at a slower rate. So far I haven't found a sample
: at such a speed to allow this, but theoretically you might be able to
: fudge the conversion to maximize quality by getting it into a format
: where it has to play it at full speed (no delay) and thus best quality.
: I mean, playing back a sample on the Atari at anything besides the
: maximum speed the Atari can spit out is kinda a waste.
:
: Of course, memory was the reason for playing it slower. However,
: Megablast for instance, reserves an entire 64K to samples. Obviously it
: is trying to play them back at the maximum rate.

Hmm, what is it that determines the maximum playback speed of the Atari?
Cpu clock speed? THe Pokey chip? What?
I'm also wondering if making a little 8 bit digital to analog converter
circuit, and pumping 8 bit files through that, at the same speeds
that we currently do 4 bit files... would make sounds cleaner.

The star trek files of the Enterprise jumping into warp sound bad, so do
the little tinkling sounds and stuff you hear, but the "computer" voice
from startrek sounds okay, and as I said, the Montey Python stuff I've
been FTPing and downloading all night sound pretty decent too.
Right now, I'm downloading arced WAVs into my 800K ramdisk and doing
all conversion and playback right in there.
Floppy drive access would be torture with these file sizes and stuff.
Thank god for the Newell 1 meg, and yes, there ARE uses for the Mars 8
4 meg memory, like working but this stuff.

Jeff

: Tom Hunt wrote the .QX 256K format. I will try to get him to write out a
: tech file on it so that Bill and others can build on his work. These
: days, QXL is a little limiting. Supporting 512K and 1 megabyte is worth
: it IMO. It does take a while to load a 256K sample though, even off the
: hard drive!

Hi folks !

Many of you may think that CSA8 is the only group dealing with your littel
ATARI, but that's not true any longer !
Here in Germany, we have installed an area for the 8Bit-Ataris in the T-
Netz, The T-Netz is routed by most of the BBSs that route the Z-Netz.
So if you are able to receive the T-Netz, ask your Sysop that he or she
should order the area
/T-NETZ/RECHNER/ATARI/8BIT.
If it is not in your local BBS, write me a netmail, I'll tell you, where
the next BBS is, that routs this area.

Also mail me for further information !

LONG LIVE THE XL !

CU !

Freddy.

>between Commodores and Ataris belongs either there or here... and seeing as I
>was the one who started it, and my question as to "What can the Commodore do?"
>should be directed to C= users rather than /|\ users, I picked the C= group to
>ask on. They had no problem until today/last night.
At comp.sys.cbm, it's not quite the same thing as "I hate the emulator!" posts,
because comp.emulators.cbm was started to get rid of emulator questions in
comp.sys.cbm. I found the Atari/C= comparisons interesting, but there are
those in the group who probably don't want to hear about anything other than
C=. (Not including me)
>
>Pretty strange huh? I guess I'm just bitching (it's rubbing off my mom >:^( )
>so I'll shut up now, but have any of you others gone into the realm of the .cbm
>group? I know Itay did, which piqued my interest in it, but he only seemed to
>find triva questions, whereas I found typical posts like I'm used to seeing
>here (except without the emulator posts here and there)...
There are trivia questions on comp.sys.cbm. A set of questions are posted,
people mail answers to the person who posts the questions, and the answers are
posted a few weeks later. People then discuss the answers.

>
>grumble
>
>-bill
>kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu
>William (Bill) Kendrick / | \ ** New Breed Software **
>no .sig, too pissed

Ot> And more one point. I need chips called "MAX232" or "ICL232?" to
Ot> make circult of Sio2pc. If someone have it too, please give(sell)
Ot> me it...

Dont you have any Curquit dealer near you.?? That ship is very commen here and
its very sheap. $4-$5.

Ot> In Jpaan, it costs me about $10 to send money to foreign country. I
Ot> think SIO connector and chips are very cheap, so I don't want to
Ot> send money as possible as I can.

Thats the same price here but I have find a very sheap way to send money to
other countries. I have something we called Postgiro and Bankgiro here. I have
both to weite and send my bills at home and post it in an ordinary postbox. My
brother in Law who is little chief over one postoffice informed me that it will
be 70% cheaper to send foreign money transactions over my Postgiro. Ask your
nearest Postoffice for more information.!!
Nippon is so big so you must have a system like us i think for those
transactions.??

Let me know if you find the ship or not in Nippon or we shall work something
out. They must have the ship in Tokyo.

L> people should bow down before me or shower me with praise. This is
L> simply something that I want to do that will, if successful, benefit
L> all Atari users. Is there something wrong with that?

No it isnt. I think you doing a good job for us as there is a lot of old nice games for example i want to store in my BBS I soonwill put up.

I can do that now and no one will complain as there hav'nt been anyone in this country who have dealed whith the oldies for at least 4 years now. If we want something new (or old) stuff to our oldies we have to go England, Germany or the States to buy it.

There is an bigger chance that the oldies will get started to be used here again and that is if we easy can support our users also whith (commersial stuff/games) that used to be some stores livng.!!

So Thanatos. Keep on working. I think you doing a nice job for us, specialy if we Sysops want to have a lot of stuff in our BBSes and a cleaned mined that tells me, I'm doing a STraight thing.!!

I dont really understand peaples complains.?? Can someone explain that in a serius way.?? CB-o

Hi Jeff,

Please send me this patch program via UU if you can, and any other small utilities that don't work on 3.2g. I suspect people have patched directly into undocumented addresses in 3.2, but if I can find out which ones are commonly used, I may be able to reassemble the current 3.2 to have those addresses in the same place.

```
------------------------------------------------------------------------
!!! NEUES BRETT Fï¿½R DIE ATARI 8BIT RECHNER IM T-NETZ !!!
------------------------------------------------------------------------

Bislang gab es bis auf das englischsprachige Brett comp.sys.atari.8bit im
UseNet keine andere Kommunikationsplattform fï¿½r die "kleinen" ATARIs.
Jetzt gibt es im T-NETZ jedoch ein eigens fï¿½r die deutschsprachigen
Anhï¿½nger dieses Rechners eingerichtetes Brett: T-NETZ/RECHNER/ATARI/8BIT.
Es wird bereits von den meisten groï¿½en Servern im Z-Netz geroutet. Sollte
es Dein Sysop jedoch noch nicht fï¿½hren, so bitte ihn bitte zu dessen
Bestellung, um mï¿½glichst vielen ATARIanern die Mï¿½glichkeit zu geben,
dieses Brett zu nutzen. Es wird u.a. auch ï¿½ber den neuen ATARI 8-Bit
Emulator fï¿½r PCs gesprochen, der gerade erschienen ist.

Nï¿½here Infos zum Brett bekommt Ihr bei mir oder auch bei
FREDDY@1ST-TRAC.TOPPOINT.DE .

Also, wann lesen wir voneinander im neuen ATARI 8Bit-Brett :) ?

From: krishna@max.tiac.net
Message-ID: <31efrl$3ju@sundog.tiac.net>
Source record: 99331

Could someone explain how IBMASCII works?

How does an IBM term receive a ball rather than ringing the bell (^G) and all the rest of the ^A-^Z series?

Does anybody know some mysteries about the devourer and the boat-keeper?
and by the way any disks after The Dungeon even in beta-versions/

4367. TVs and 1050s

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-31 00:56:17 UTC
From: sydtech@winternet.com
Message-ID: <31esrh$h64@blackice.winternet.com>
Source record: 99336

How badly do 1050s behave when placed next to T.V. sets?

I rearranged my Atari stuff today. I've got my 1200XL on a table in front of an older model 13" color T.V. The TV is up on an old monitor swivel base I yanked off my Epson monitor. I would say it raises the TV maybe an inch or so off the table - enough so that the computer doesn't interfere with viewing the TV and I can get the 1200's cables underneath it.

I originally had my 1050 slid all the way back on the table so that the front of the drive was about even with the front of the TV. I turned the system on and promptly got a boot error off the drive. I checked the SIO cable and tried again. Same thing. Weirded, I switch SIO cables with my SX212. Same thing.

To make a long story a little shorter - if I move the drive forward a few inches or move it about 6 inches to the right of the TV (and back further), it works fine. It appears that having the back of the disk drive near the back of my TV set wreaks havoc. Is this caused by the TV's magnetic field?

None of the other equipment on the table (an Atari 7800 and a 5200) are having any problems....

Thanx,
Sydtech (NOT a hardware dude!)

....and Jungle Hunt for the 8-bit. These are the only titles I like on my 5200, and once I get 8-bit replacements for 'em, the 5200 is going up for auction.

Thanks!

4369. digiplay

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-31 02:55:35 UTC
From: jjmcwill@next5
Message-ID: <31f3r7$7d9@mtu.edu>
Source record: 99337

Well, I've been modifying Bill Kendrick's digiplay.tbs, being too lazy
to rewrite the thing in Action! which would be more useful.
I've got it using 8 banks plus the main bank now, so that it can play
files up to the size of 128K or a little more.

The problem is, when you convert WAVs that are really hugs into DIG
files, it can't handle those big sizes, so the ASCII size of the file
which is stored as part of its header ends up being zero.
WHen that happens, since I"m running Sparta-X, I use the XIO 39 command
(if I remember correctly) to ask DOS for the file size, and then
subtract about 16 bytes for that, for the header, and go from there.
It seems to work okay. I wish I could use it with something other than
SD-X though, since I only have the one cartridge. I"ve been trying to
convert it over to BASIC-Xl, but so far not much success. It's choking
on the string definition for the ML subroutine which actually
plays the digitized data. I thought I had that licked, but it locks up
when the USR call is made.
The user intrface still consists of typing in the filename, and then
inputting a character from the keyboard which is used as the speed index.
It keeps the program small; I'm afraid of the code running into the
$4000-$7fff space.

I guess it could support more banks, the bank data is on a data line,
and you could just change that and the maxsize= line, assuming
TBXL doesn't have any problems with REALLY big numbers files sizes.
Also, converting WACs to DIGs takes forever withthe TBXL program.
Again, it would be a heck of a lot faster as a ML or compiled action!
file, but I'm too lazy to hack into it and besides, I move in three weeks
and I'm busy packing.

ANybody else here interested in playback of sound files?

Message-ID: <31f3ui$lsq@dartvax.dartmouth.edu>
Source record: 99338

I always found that my 810 and 1050 (before it died) behaved much
better when placed away from my TV. Apparently the magnetic field
from the TV was causing a lot of interference. This may depend a lot
on your TV.

>C= people are sensitive because in order to get good performance they
>have to pay big bucks for both an interface and a PROPRIETARY hard
>drive. Whereas we can use off the shelf drives at a fraction of the cost.

There's also 64NET, which involves connecting a PC to the 64, and allowing it
to use the PC's drives (including hard drives). This doesn't have to involve
paying big bucks. (I paid 10 bucks for my IBM PC. I bought it mainly for its
color monitor, which I use on my 128)
>
>C= can do better ANSI emulations (especially the 128). The 128 is a

>Obviously they mostly use a replacement DOS rather than the regular
>crappy one. Novaterm for the most part blows Bobterm away from what I
>hear. Everything is in it.
Desterm, for the 128, is also pretty good.
>
>However, the extra RAM in the C= is rarely if EVER used for anything but
>a ramdisk. With the Atari although this is a problem, there are a FEW
>programs that make good use of banked RAM. Not really so with the C=.
>Their REU cartridges are little more than ramdrives.
I've heard of some C= programs that use the RAM for more than a ramdisk. I
think Digiplayer uses the extra memory to hold longer digitized sound samples,
for example. And GEOS uses the RAM to speed up operations.
>
>Also, their numbers must be thinning a LOT because there has been various

>
The emulators, from what I hear, aren't that great. The best thing to run C=
programs on is still a C=. CMD's drive (FD-4000) can hold up to 3.2 MB.
C='s 3.5" drive is the 1581. It's not too bad. (I have one)

:
:
Hmm, I guess that would be interesting.
Are you saying then, that Parotqxl.com outputs a different format
than the standard Parrot sampler, which I am guessing outputs the DIG format?
How strange....

I've found that even though my program is 1600 bytes saved Tbasic,
I gotta watch the code that I add. When I add more stuff to the program
to remedy certain bugs in loading and playing, Turbobasic seems to lose
track of loops during execution. I think this is an indication that
somehow BASIC code or variables or something is running into the Banked area.
This itself is very odd. I took out the DIM DIGDAT$ 30000
(er whatever he called that variable) and I reference $4000 directly.
Because of this, the program reports a fre(0) or more than 30000 bytes
even after all variables have been dimmed and stuff.
Very odd.. I'm curious as to what sort of a compiled program this would
produce, and how IT would be effected.
Last time I went through I hunted down all my popular constant references,
turning them into constant variables (these were $d301, $4000, and
16384). THe only other space saving technique I thought of would be to
load the actual ML program into the memory region above $7FFF manually,
from a disk file. But that is only 154 bytes.

Does anyone have any ideas why TurboBASIC would behave so strangely?

I certainly feel fortunate using Sparta-X on this, but I worry that
others won't have much success running it on DOSes with higher LOMEMs.

William Kendrick (kendrick@zippy.sonoma.edu) wrote:
: Hey Jeff, rather than use a Sparta call, why not screw with the code some to
: get it to load until EOF (just do a set of BGETs of about 8k or something,
: then when there's an error, check the locations 40,41 for the size of the
: last BGET and then 8 * (#_of_reads - 1) + DPEEK(40) will be the total size
: of the file... Also yeah, I never even thought about the file-size thing
: rolling over to zero. It's been a while since I actually looked at the code
: in NLODPLAY, does Parrot store the size in ASCII (00000-99999) or bytes?
: (0000-FFFF)?

I had sort of been trapping the load routine the way you mentioned, but
then like I said, as I added more code to fix some "bugs",
wierd things happened, and one of them was the trap didn't work anymore

Just before the load routine I had like a trap 32200, which was just:

32200 trap 40000:goto 31500, where 31500 was the end of the read loop,
to close the IOCB channel and ENDPROC.
Well, all of a sudden I start getting errors that the ENDPROC didn't match
any existing PROC or EXEC calls, even though it worked fine before.
I tried making sure to pop off the FOR-NEXT loop and everything.
Very strange. That's when I gave up and did it the XIO way instead.

On the second one, there is a VAL(DUMMY$(7)), which is where it gets the
file length from the header. So I'm assuming it's ASCII bytes, not
Hex bytes. Your CNVRT48.TBS program has a problem with some of those
bigger files, it seems to finish okay, even though it crashes with an
error 5. Very strange, but I'm glad that it's working now, albeit
on a system running only SD-X.

I think I'm about fed up with people who are using the failure of AC to soothe their own guilt for not supporting the publication while it existed. Pab Sungenis's recent comments do a great injustice to the 400-odd people who did loyally support the publication in the past, & the several hundred ohers who are presently supporting it under its new management.

Contrary to Pab's assertions, the recent listing of AC's achievements by Jeff McWilliams in response to negative remarks by Steve Godun was entirely appropriate.

Both Jeff & I made a serious effort to interest Pab in supporting AC as a subscriber & as an author. Pab refused on both counts. Pab failed to mention that in his recent post.

To see Pab then turn around & attack Jeff in a public forum like this is really quite dreadful. I must protest Pab's mean-spirited treatment of Jeff in the strongest possilbe terms.

Pab, you owe Jeff McWilliams a BIG apology!

Are you man enough to do it?

All this talk about the 1400 and 1450 got me curiouse so I went through my Atari Catalog collection and there they were right on the cover. They are in Catalog # CO17535-05 dated 1983.
The only difference between the two is the built-in double-sided. dual density slim line disk drive in the 1450XLD. The case approximately doubled in height right behind the function keys and the drive resides on the right side. There doesn't appear to be anything on the left side in the double height space.
Both came with a built-in 300 baud modem and had built in telecommunications software.
Other specs for the 1400X/1450XLD were as follows.
64k RAM,24kROM (op.sys Plus Basic), 66 keys, including help key,4 spec.func.keys, 4 progable.,12 pre prog., 29 graphic keys.
Internation.char.set,
6502C proc.,1.79Mhz,GTIA,Pokey,ANTIC,320x192 re., 256color(128 at a time)5 text modes,40col.display,4 voices 3 1/2 oct range,
1 cart.slot 2 joyports voice synthesizer.
BOTH have a built in modems Available October 1983.
Hope this helps, Gale Putt

>Basic at this point is that it doesn't blank the screen or use up any
>Pokey channels. It still hogs the Basic interpreter when it's talking.
>If you could get it to change speed and pitch then I'd really be happy!

I'm ALSO not sure I could accomplish anything productive, given your remarks about the voice device being a PERIPHERAL to which one simply SENDS commands which are dealt with "externally" to the CPU. If that's the case, my trying to trace the handler would get only so far: Imight be able to discover what commands (OPEN/CLOSE/PUT/XIOs) it supports, but quite possibly not much else, and maybe not even that. It would be like trying to use MAC/65 and DDT to look at the "program" that runs inside the 1050 disk drive. It's there, but you can't get at it. Or perhaps I should say, -I- can't. Bob Puff surely could. I'm a software man, myself; if there's a handler that lives in Atari memory and runs on the 6502 main CPU, I can find and comprehend it -- but if it's offboard I'm clueless; to me it's "FM" ("F***in' Magic"). :-)

Still, that bit about hogging up the BASIC interpreter when speaking from BASIC suggests that the CPU may be at least a LITTLE involved -- if it has to defer all other tasks while speaking, a la S.A.M. -- but on the other hand, the ability to multitask the voice during selftest suggests that it "ain't necessarily so." The hogging-up of BASIC during speech may be more a property of BASIC itself, than of the speech hardware. In any case I would require any and all speech-related and 14xx-quirk-specific docs you have, in order to have even a chance at figuring this out.

In addition to whether or not I would accomplish much, I must express serious misgivings about whether or not I would GET AROUND TO IT in a finite amount of time. I'd probably jump right in and dig the first

day or two that I had it, then get sidetracked and not get back to it for very likely several months or longer. I hate holding onto other people's stuff for that kind of time, knowing they're waiting for me to do something with it or at least send it BACK. I'm a terrible procrastinator, no Bob Puff to be sure. I'd sure like to take a look at it, though! Sigh -- such a dilemma...

>Also, if you come away with more info on speech chips maybe you'd be
>interested in developing a cheep-talk-like board [...]

Interesting idea, but I may not be your man. I would probably learn a bit more about speech chips (I'd need the data sheets for the speech chip itself, BTW) than I ever expected to, but my interest, comprehension etc. would be forced to center around how-to-program-it rather than how-to-wire-it-up. Sorry...

>It would indeed be stupid for Atari not to allow
>manipulation of the onboard facilities for pitch and speed let alone
>adding the trivial amount of circuitry to expand it even more.

When did potential stupidity EVER stop Atari from cutting corners? Just check out Ben Poehland's laments about Atari's cheap video circuitry...

>rumors of Speech demo software SINGING on the 1400 [...]

As I said in an earlier post, there are an AWFUL lot of unsubstantiated, unsubstantiatABLE, rumors about the 14xx machines. Anything may be possible. :-) The rumored/hinted/hoped-for ability to change the pitch of the 1400's speech may be either a holy grail or simple wishful thinking.

Kevin Atkinson (kevina@clark.net) wrote:
: > BITTE HOLT EUCH DAS FILE "XF210GER.ZIP" UND VERBREITET ES
: > !KEEP THE ATARI 8BIT ALIVE!

: Ok does anyon know what this says (IN ENGLISH!)

It's an announcement for XFormer V2.10 with German keyboard layout. That
guy really should check which newsgroups he posts to before he does so.

Bye,
Thomas

PS: You really should shorten your quotes!

11.3) Can I read/write DOS disks on an 8-bit Atari?
11.4) How do I transfer files using a null modem cable?

Storage Media
12.1) What 5.25" floppy disk drives are available?
12.2) How can I use 3.5" floppy disks with my 8-bit Atari?
12.3) What do I need to connect a hard drive to my 8-bit Atari?
12.4) How can I use an IBM-PC as a storage device for my Atari?

General Interest
13.1) What's the best DOS for the Atari?
13.2) What hardware has Atari created in the 8-bit computer line?
13.3) What are the pinouts for the...?
[to add: M.U.L.E./Mule, power supply requirements]

Other Documents of Interest
14.1) What product developers or vendors support the 8-bit Atari?
14.2) Where is my nearest 8-bit Atari BBS?

14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?

==========
1.1) What is this 8-bit Atari FAQ List?

The Atari 8-Bit Computers Frequently Asked Questions List was created to provide answers to many commonly asked questions found in news:comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8. It is in a constant state of development.

Much of this FAQ List is geared toward providing information on the various Internet resources available for 8-bit Atari users.

Where to get the latest copy of the 8-bit Atari FAQ List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto::mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/faq
quit

Finally, you can always ask me for a copy at mailto::mcurrent@carleton.edu

This FAQ List is automatically posted to news:comp.sys.atari.8bit, the Info-Atari8 Digest, INFO-A8, news:comp.answers, and news:news.answers, every 30 days.

==========
1.2) What is an Atari 8-bit computer?

To be written. He knows who he is. :)

==========
2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Internet's Info-Atari8 Digest and in BITNET's INFO-A8.

[I'd like to include the charter for news:comp.sys.atari.8bit here. Anyone know where to get it?]

==========
2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements.

==========
2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating the usefulness, or uselessness, of all Atari computing platforms. If you're into flaming about Atari 8-bit computers, this is the place for you.

==========
2.4) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

==========
2.5) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements.

The moderator may be contacted at mailto::emulators-request@qualcomm.com

==========
3.1) What is the Info-Atari8 Digest?

If you do not have Usenet access, but you do have Internet e-mail access, you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto::info-atari8-request@pine.cse.nau.edu

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto::comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in BITNET's INFO-A8.

Note that any posting sent to mailto::info-atari8@pine.cse.nau.edu will NOT be cross-posted to the Usenet side. The maintainer is presently working to correct this.

The Info-Atari8 Digest maintainer (not moderator) is:
Mike Todd, mailto::snyder10@convex1.TCS.Tulane.EDU

==========
3.2) What is INFO-A8?

If you do not have Usenet access, but you are on BITNET, you can access this group through the INFO-A8 listserv.

The BITNET subscription commands are:

tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

This is not a standard BITNET mailing list. It is a distribution of the Internet's Info-Atari8 Digest. In order to send mail to all of the subscribers, both in BITNET and the other networks you should not send your mail to the BITNET address (INFO-A8@MARIST) but instead send to the Internet address: mailto::comp-sys-atari-8bit@cs.utexas.edu.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST. Please note that this command must NOT be sent to the BITNET list address INFO-A8@MARIST or to mailto::comp-sys-atari-8bit@cs.utexas.edu, but to the LISTSERV address LISTSERV@MARIST.

Contributions sent to this list are automatically archived. You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST. These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Please note that it is presently possible for anybody to determine that you are signed up to the list through the use of the "REVIEW" command, which returns the network address and name of all the subscribers. If you do not wish your name to be available to others in this fashion, just issue a "SET INFO-A8 CONCEAL" command to LISTSERV@MARIST. More information on LISTSERV commands can be found in the "General Introduction guide", which you can retrieve by sending an "INFO GENINTRO" command to LISTSERV@MARIST.

The INFO-A8 maintainers (not moderators) are:
HARRY@MARIST (A Harry Williams)
mailto::RAVI@SPEEDY.MCNC.ORG (Ravi Subrahmanyan)
mailto::RAVI@MCNC.ORG (Ravi Subrahmanyan)
mailto::BILLW@SCORE.STANFORD.EDU (Bill Westfield)

INFO-A8 was created on December 9, 1986.

==========
3.3) How can I access the Atari Archive by e-mail?

Downloading

BART - Brode's Archive Retrieval Thang - the Atari Archive e-mail file server

To learn about using BART to access the Atari Archive, send e-mail to:
mailto::atari@atari.archive.umich.edu. The subject of the message doesn't
matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to mailto::lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

==
3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto::ftpmail@decwrl.dec.com with no subject line, and two-line
body with line one help and line 2 quit

2) mailto::ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto::bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto::BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

==
3.5) How can I post to Usenet newsgroups by e-mail?

Given a Usenet newsgroup name in the form news.group.name, you have at
least these two choices:

a) mailto::news-group-name@cs.utexas.edu

b) mailto::news.group.name@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

==========
4.1) How can I access the Atari Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number of files for many computing platforms, including the Atari 8-bit computers. Our 8-bit Atari Archivist is Jody Lenn, mailto::lenn@atari.archive.umich.edu; the Atari Archive as a whole is maintained by Mickey Boyd, mailto::boydm@atari.archive.umich.edu. The best way to contact the Atari Archivists is mailto::atari-archivists@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your user name, and your e-mail address as your password. All of the following FTP sites follow this convention.

Downloading

(Try the site nearest you first)

a) ftp://atari.archive.umich.edu/atari/8bit
(141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/mirrors/archive.umich.edu/atari/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, Great Britain)

d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://nic.switch.ch/mirror/atari/8bit
(130.59.1.40, Switzerland)

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in:
ftp://atari.archive.umich.edu/atari/8bit/New
(141.211.120.11, United States)

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files (.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file describing what your upload is, so our 8-Bit Archivist will be sure to place it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

Newly uploaded items may be found in
ftp://atari.archive.umich.edu/atari/8bit/Newitems

==========
4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston
University. It is maintained by Adam Bryant, mailto::adb@albert.bu.edu.

ftp://cs.bu.edu/PC/ATARI (128.197.2.2, United States)
(user name "anonymous"; password is your e-mail address)

==========
4.3) What is the PVV Archive?

This is an Atari FTP site maintained by Eyvind Bernhardsen,
mailto::eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/atari/8bit (129.241.36.207)
(user name "anonymous"; password is your e-mail address)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

==========
4.4) What is the ClarkNet Archive?

This 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto::kevina@clark.net

ftp://ftp.clark.net/pub/atari
(user name "anonymous"; password is your e-mail address)

==========
5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is like a huge public bulletin board system,
and it is the hub system of the NPTN, the National Public Telecomputing
Network. Those persons with full Internet access can TELNET (this does
not mean FTP) to telnet://freenet-in-a.cwru.edu,
telnet://freenet-in-b.cwru.edu, or telnet://freenet-in-c.cwru.edu
(129.22.8.32, 129.22.8.51). Applications for free accounts are handled
online, or you may browse the system as a visitor. Once logged-in, type
"go atari" to reach the Atari SIG. Those who add their names to the Atari
SIG user directories are automatically members of the official Atari user
group C.A.I.N. - Central Atari Information Network. Send correspondence
and press releases to mailto::xx004@cleveland.freenet.edu. The Atari SIG's
8-Bit Computers Support Area is maintained by Michael Current,
mailto::aa700@cleveland.freenet.edu, the 8-Bit Technical Forum is
maintained by Craig Lisowski, mailto::aa853@cleveland.freenet.edu, and the
Atari SIG Manager is Len Stys, mailto::aa399@cleveland.freenet.edu.

==========
5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)
Via Modem: 216/742-3072

Youngstown Free-Net Atari SIGOps:

Joe Perkins (mailto::ac742@yfn.ysu.edu)
Joe Sabatino (mailto::ab588@yfn.ysu.edu)

Atari SIG (mailto::xx140@yfn.ysu.edu)

==========
5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)
Via Modem: 613/780-3733

National Capital Free-Net Atari SIGOp:

Christopher Browne (mailto::aa454@Freenet.carleton.ca)

==========
6.1) How can I retrieve files from the Atari Archive through Gopher?

The Atari Archive has a Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Atari Archive's 8-bit directory. I personally
recommend this method for downloading from the Atari Archive.

There is also a mirror archive site with a Gopher server:

gopher://src.doc.ic.ac.uk/11/computing/systems/atari/umich/8bit

==========
7.1) What is the Atari Classic Homepage?

Maintained by Eyvind Bernhardsen, mailto::eyvind@pvv.unit.no. Point your
Web client to:

http://www.pvv.unit.no/~eyvind/atari/

==========
7.2) What is the Atari 8-Bit Home Page?

Run by mailto::ipoorten@cs.vu.nl (Ivo van Poorten). The URL is:

http://www.cs.vu.nl/~ipoorten/8bit.html

==========
7.3) What is the Atari 8-Bit Resort?

This one is kept by mailto::un55@rz.uni-karlsruhe.de, Marek Tomczyk. URL:

http://rzstud1.rz.uni-karlsruhe.de/~un55/8bit.html

```
============================================================
7.5) How can I access the Atari Archive by AFS?

Downloading
-----------
Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading
---------
Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
ftp://atari.archive.umich.edu/atari/8bit/Archivers/uudecode.bas
just ENTER this into Atari BASIC
ftp://atari.archive.umich.edu/atari/8bit/Archivers/uudecode.doc
the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
ftp://atari.archive.umich.edu/atari/8bit/Archivers/yau.arc - contains both
yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
ftp://atari.archive.umich.edu/atari/8bit/Utilities/uue.arc - contains
uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
ftp://atari.archive.umich.edu/atari/8bit/Cc65/dumasuu.arc - contains
uud.com, uue.com, CC65 sources.

==========
9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
ftp://atari.archive.umich.edu/atari/8bit/Archivers/superarc.arc - both
Super Un-Arc and Super Arc

ftp://atari.archive.umich.edu/atari/8bit/Archivers/suprarc2.arc - just
Super Arc
ftp://atari.archive.umich.edu/atari/8bit/Archivers/supunarc.com - an
un-arc'd copy of Super Un-Arc
ftp://atari.archive.umich.edu/atari/8bit/Archivers/supunarc.uue -
uuencoded copy of supunarc.com

==========
9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
ftp://atari.archive.umich.edu/atari/8bit/dskcom32.arc
ftp://atari.archive.umich.edu/atari/8bit/Archivers/diskcomm.arc

==========
10.1) What 8-bit Atari emulators exist for other computing platforms?

1) ST Xformer, from Branch Always (see companion vendor/developer list)
a freeware 8-bit Atari emulator for the Atari ST.
[how about a URL!]

2) PC Xformer 2.0, from Branch Always (see companion vendor/developer list)
a freeware 8-bit Atari emulator for DOS/Windows/OS/2. URLs:
ftp://atari.archive.umich.edu/atari/8bit/Xf2/xf2.zip
ftp://ftp.clark.net/systems/msdos/emulators/xf2.zip

3) "The German PD emulator for DOS"

Don't expect much from this program, it isn't done yet. URL:

ftp://atari.archive.umich.edu/atari/8bit/Misc/at800xl.zip

4) "The 8-bit Atari emulator for X/Windows"

Nearing release, from Frank E. Barrus, mailto::feb6399@ultb.isc.rit.edu

==========
11.1) What are the best telecommunications programs available?

Here are some of the more popular PD/shareware terminal programs
available on the Atari Archive:

BobTerm, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/bterm12.arc

Kermit-65, public domain by John Dunning
Emulates: VT100

Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65v37.arc - latest version
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65doc.arc - documentation
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/omnicom.arc

VT850, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/vt850b1.arc

==========
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs on the atari.archive of this variety. Note
that these require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - Try this one first! URLs:
ftp://nova.pvv.unit.no/pub/atari/8bit/utilities/disk/myutil.readme
ftp://nova.pvv.unit.no/pub/atari/8bit/utilities/disk/myutil.zip

==========
11.3) Can I read/write DOS disks on an 8-bit Atari?

If your highest-capacity floppy drive on your Atari system is the
Atari 1050, you won't be able to use ATARIO, SpartaRead, or UTIL. You
still have the following alternative:

Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.

ftp://atari.archive.umich.edu/atari/8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/mule.exe - IBM Mule
ftp://atari.archive.umich.edu/atari/8bit/Diskutils/mule.txt - descriptive blurb

==
11.4) How do I transfer files using a null modem cable?

This section by mailto::cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on each computer. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. (Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25-pin port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need

a Multi I/O or Black Box, which use the PBI (parallel bus),
then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

==========
12.3) What do I need to connect a hard drive to my 8-bit Atari?

original my mailto::Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
ICD Multi I/O various 256 byter per sector
restriction. 256K and

1 meg ramdisk models.
Printer and modem, modem
will handle 14.4K baud
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==========
12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto::d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC is a shareware product from Nick Kennedy, whose contact information may be found in the companion vendor/developer list.

[Atari Archive filename(s) should be placed here!]

==========
13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the Atari Archive. URLs:
ftp://atari.archive.umich.edu/atari/8bit/Fte (SpartaDOS files)
ftp://atari.archive.umich.edu/atari/8bit/Os (MYDOS files)

==========
13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS
800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7-pin dot matrix, same as Commodore MPS-801)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D

1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

==========
14.1) What product developers or vendors support the 8-bit Atari?

There are two files available:

1) Atari 8-Bit Computers: Vendors and Developers
Available from:
ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers
mailto::mcurrent@carleton.edu
and all other archives of Usenet FAQ lists.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's
Advertising Editor, Bob Scholar, r.scholar@genie.geis.com. This list focuses
on North America, but all sources listed have been personally confirmed by the
AC staff.

==========
14.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained
by Lawrence Estep, AC's Telecommunications Editor, 71450.1050@compuserve.com.

==========
14.3) Where is my nearest 8-bit Atari user group?

An 8-bit Atari user group listing is maintained by Atari Classics
magazine's Exchange Editor, James King, KAMARO_KID@delphi.com.

==========
14.4) How do I use my new or emulated Atari?

"The Unofficial Atari 8bit News / Stupid Question / Emulator Help FAQ" is
maintained by Bill Kendrick, mailto::kendrick@vax.sonoma.edu. You can
write to Bill at New Breed Software, 59 Palm Lane, Novato, CA 94945.

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Vendors and Developers List

Revised 19-Jul-94

Additions/suggestions/comments/corrections having to do with this
Vendor/Developer List are requested. Please send to:

Michael Current
mailto::mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

Where to get the latest copy of the Atari 8-Bit Computers
Vendors and Developers List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto::mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at mailto::mcurrent@carleton.edu

================================================================

"All" commercial vendors and developers should be listed here. "Major"
shareware developers are also listed.

8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List, available separately.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

==========

This list won't be accurate and complete without YOUR help!

4393. 80-column display and word processing

Newsgroup: comp.sys.atari.8bit
Date: 1994-07-31 21:15:48 UTC
From: jhs@cat.syr.edu
Message-ID: <9407312115.AA06413@cat.syr.edu>
Source record: 99257

I have copies of the source code to David Young's OmniView 80-column "E:"
device and to his 80-column OmniWriter word processor which uses it.
A few years ago he told me it would be OK to release these files to the
Atari community at large. If anyone would find them useful please e-mail
me at this address jhs@cat.syr.edu and I'll see if I can locate the
appropriate disks. I'd also sort of like to confirm with David that he
still feels that way just to be sure I didn't dream it or something...

-John Sangster
(...whose only Atari claim to fame is authorship of UUDECODE.BAS awhile back..)

4394. I need a European/PAL 8-bit!!

: Hmmm...! I didn't really expect a positive response; my original remark
: was more-or-less intended jokingly. I'm a bit stunned by your offer!

Well, I'm a nice guy. I sent my computereyes to Clay Halliwell in hopes that he would update the capture software for easier colrview implementation. He's had it for a long time, but since I don't currently have a camera, I wasn't going to use it. Although if I had it all these months I may have rented one or something. Same deal here, the 1400 does nothing for me just sitting here, it would be more productive if someone was peeking through it.
:
: Still, that bit about hogging up the BASIC interpreter when speaking
: from BASIC suggests that the CPU may be at least a LITTLE involved --
: if it has to defer all other tasks while speaking, a la S.A.M. --
: but on the other hand, the ability to multitask the voice during selft-
: est suggests that it "ain't necessarily so." The hogging-up of BASIC
: during speech may be more a property of BASIC itself, than of the
: speech hardware. In any case I would require any and all speech-re-
: lated and 14xx-quirk-specific docs you have, in order to have even a
: chance at figuring this out.

I'd send you the text file I have on the V: device as well as a note on the creative computing issue. There is a collected creative computing book, it's in there. That's where I saw it. (stuff about the SC-01 in general, not the 1400)

I have no trouble lending it to anyone. This is a public forum so it would be hard to fathom for the recipient to run off with it, for he would have many witnesses to the theft. The last time I cut a deal that didn't work right (with Terry Ortman) the collective Atari community over at Carina came down hard on him. So not only do I trust Atarians for the most part, I also know that it is unlikely in a pragmatic context that someone would run off with my stuff.

The offer stands for you or anyone else who wants to put the work in.

Maybe so, but at least I know that you can't get reliable 9600 or above
on a P:R: or 850 ;^)

And another thing, I don't think many 8-bitters are perfectly content
about the state of affairs. It's natural to feel uncertain about the
future and how we will act in response to it. My unease over the fate of
the 8-bit began when I had to special-order SAM (It wasn't in stock, but
C= versions were) at a mom-and-pop software place, and when I saw the
8-bit software disappear off the shelves of Lechmere. The next stage
being the decline of Antic/Analog, then the next stage was the formal
announcement of the end of 8-bit suport from Atari. In the last 2+
years of my "getting back into it" mode the one thing that kept me
excited more than anything else was CSS. The sale of ICD rights to FTE
came as a wonderful surprise, but I should have known that the stuff
wouldn't come cheap.

I don't know what was actually built, but I do clearly remember that
the catalog (and maybe the DOS 3 manual) said the 1450XLD had one
double-sided (dual-sided? :-) drive, with a magnetically shielded
space supposedly usable for storing disks or adding a second drive.

That may be, but just look on page 15 of the Rev. 9 Best Catalogue
guide. 2 drives dude. 4 drive IDs total. I recall ads from
(computability?) taking $CALL orders in advance for the 1400 and 1450 and
they had a picture as well with 2 drives (circa 1983).

If you look closely at the picture you will see that the close mechanism
is different from a 1050. It actually looks like a modern HH 3.5 mech
with the button style release!

But it is still a little hard to tell...

4404. Want some computer gaming fun? CAIN Atari Fun Fest 94

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-01 03:51:11 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <31hrff$2ma@usenet.INS.CWRU.Edu>
Source record: 99268
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

This will be the last Usenet posting about this show besides the complete dealer/vendor, developer, user group listing which will be posted on Thursday.

CAIN Atari Fun Fest 94

Are you bored of playing the same old games?

Do you have an Atari Jaguar, Lynx, ST, TT, Falcon030, 800, XL, XE, XEGS, 7800, 5200, or 2600?

If you have any one of these systems, you can get games for it at the CAIN Atari Fun Fest 94.

CAIN Atari Fun Fest 94 is being held on Sunday, August 7, 1994 at Kirtland, Ohio (near Cleveland). CAIN Atari Fun Fest 94 will be fun for the entire family. You'll get an opportunity to see the JAGUAR 64-BIT Interactive Multimedia System and the latest entertainment titles for it. You'll even get to see video games played like they have never been played before! And that is through Lynx portable video game systems all linked together. This incredible multi-player action will blow your mind away!

The new Atari Falcon030 computer will be there along with the ST and 8-Bit computers!

There will be prizes to win and you might even be one of the lucky people to take home a Jaguar 64-BIT system or a Tempest 2000 cartridge (courtesy of Atari Corporation)! There will be many prizes raffled off such as gift certificates and games of all sorts! Everyone that attends will get a chance to win!

CAIN Atari Fun Fest 94 is the Atari -=- FUN -=- show of the year! Don't miss it! Bring the entire family down! Get great deals! See the latest technology! And have a lot of fun!

Central Atari Information Network
Presents
C.A.I.N. Atari Fun Fest 94
August 7, 1994 / 10:00AM to 5:00PM
Knights of Columbus Hall
7637 Chardon Road
Kirtland, OH 44094

^
* THE FIRST CLEVELAND-AREA ATARI SHOW IN YEARS!!! *

^

Free Admission!

What to See and Do!

The New Jaguar Game System!
The LYNX handheld game unit
Bring your LYNX and games to COMLYNX with other players!
The Falcon Multimedia computer
Gemulator (IBM emulator running Atari ST Software)
8-bit computers and products
16/32-bit computers and products
Portfolio palmtop computer
Meet the editors of C.A.I.N.
Classic game systems 2600/5200/7800 and games
Catalogs and brochures for Atari line of products
Atari products for sale / Plus Much More!

4405. Re: C=64 people are weird

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-01 04:50:26 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <BM0SzBq.lmcclure@delphi.com>
Source record: 99269

In a message dated 7-28-94, Glenn Saunders said:

"C= people are sensitive because in order to get good
performance they have to pay big bucks for both an
interface and a PROPRIETARY hard drive."

Actually, the CMD drive uses a standard SCSI mechanism. The difference is that you cannot buy the interface without buying a SCSI drive, case and power supply from CMD. <grin>

"Whereas we can use off the shelf drives at a fraction
of the cost."

That fraction might not as small as you think, especially if you compare new equipment. Price the cost of a Black Box, a 40meg 3.5" 1" high SCSI mechanism, SCSI cable, case and power supply. Now compare that to the CMD prices (i.e., $395 for 40meg, $495 for 85, $595 for 100, $695 for 200meg, etc. [May 8 price list]).

Of course, one can buy a used SCSI drive (even a old 5.25" drive or smaller 3.5", saving more money, by trading off other factors), and use any power supply available inexpensively that will work, and skip the case, but even then, and come out a perhaps 1/2 to 3/5 the price of CMD's lowest price new HD. However, I should point out I have seen used CMD 20's (no longer sold by CMD) go for $295 or less.

"Also, their numbers must be thinning a LOT because there
has been various emulators for it on the Amiga and other
platforms I think."

Based on the messages I have seen from emulator users (mostly before the emulator newsgroup was formed), many had sold off or closeted their 64 long ago, before the emulator they were using was available. Primarily, they were just back in it because they emulators were (at least for the PC), were available for the cost of a download, as well as many game files. I would have to say it seems users of the commercial Amiga-based emulator (and the one decent shareware one), are relatively few in number.

"It's certainly a lot cheaper to run stuff off the hard
drive of an emulator (if that is possible on those
emulators)..."

Is is, if you are using a "cracked" game file. (Most games are heavily copy protected, and balk at anything that doesn't "look" exactly like a 1541 drive, and many reprogram the drive, further complicating any attempt to truly emulate the 1541 on a PC hard drive).

Actually, there are a couple of setups to use the hard drive on a PC as a drive for a 64. One is a "cart" emulator, that plugs into the cart port, and simulates a game cart, but in reality, presents a menu, and allows one to select which file to load and run from the connected PC's hard drive). Not as flexible as SIO2PC, but actually faster.

"As for floppies, CMD did come out with high density drives, even up beyond 2 megabyte using an oddball scheme I think."

First, try way beyond 2 megabyte. The FD-4000 can format ED disks to 3.2 megs, and the hi-density disks to 1.6 megs. (The FD-2000 is also available, but tops out with high-density disks). Both drives can also handle the standard 800K 1581 disks.

Second, define "oddball scheme". These drives use standard MFM formatting. With SOGWAP's latest version of BBR, they can read and write PC disks of the same density (as can Commodore's 1581). Commodore wisely abandonded both GCR formatting and non-standard drive mechs when they created the 1581, and the CMD FD-series drives follow that lead.

"C= themselves did officially release a 3.5" drive for the 8-bits if you can believe it."

This brings up an interesting piece of trivia. Both the 3.5" drive standard, and the RAM expansion standard were set by Commodore itself. In the case of Atari, the once announced Atari-brand 3.5" drive became the XF551 5.25" drive (which could be converted "back" to a 3.5" with ROM changes and a new mech), and the expanded RAM built into the 130XE was similar to an earlier PD hack, and no official Atari expansion for existing machines was ever marketed or even announced. Also, Commodore marketed a mouse specifically made for the 64 and 128. (Granted, there are programs that allows the use of a ST mouse on an Atari 8-bit, but there was never an official Atari endorsement or retail packaging of this for the 8-bit). In a less "vital" vein, Commodore computers always had an "official" Commodore-brand monitor available. Of course, much of this like.

No doubt a lot of this had more to do with the fact that since about '83, Commodore has actually been a larger (financially) company than Atari (since '84 if you factor in the the whole of Warner). But as a rule, a company-endorsed "standard" is one around which developers will more readily rally. As stated, simply trivia; interesting, but not related to the topic under discussion.

Message-ID: <Ju0RTlg.lmcclure@delphi.com>
Source record: 99272

In a message dated 7-29-94, Mike at FTe asked:

"Should FTe drop the MARS 8 project?"

I certainly would not say so, but then I have to admit to selfish self-interest in this case. <grin>

I can understand some of Glenn's concern, however. If the MARS 8 did not prove to be succesful, it would present a financial drain on your company's resources, and therefore, affect future products, as well as having consumed development time. (However, I expect much of that would be applicable to future projects in some manner).

"Is a 65816 processor really worth the time and effort?"

If it is not adding that much in cost and/or there is the real potential for it adding some signficant enhancement, I say "YES". I gotta admit, however, I would really be excited if you said there was definitely going to be a way to add non-banked 65816-specific RAM that could be accessed with the 65816 running at a faster clock speed. If 4 megs of non-banked RAM accessed by a 65816 clocked at 8Mhz would not enough to entice software writers, then the future looks somewhat dim. <grin>

"Is 4mb of memory support a waste due to lack of software?"

No. Even if it were only used as a RAMdisk, from what I gather, support for the 4 meg option adds little or nothing over the cost of supporting 1 meg, and most people could certainly make use of that, even as only a RAMdisk. For those who fully make use of 4 megs, it is just icing on the cake.

BTW, given that it is rather "late in the game", this is likely only good for hypothetical discussion, but; Given that the MARS8 relies on the "socketedness" of the 800XL, would it perhaps have been a better solution to design a replacement board that would then accept the proprietary 8-bit chips? This would also have allowed building in such items as the Supervideo mod, and perhaps making the PBI more "robust". I could see a problem with board "real estate", however. BTW, what are the dimensions of the MARS8?

4408. Re: C=64 people are weird

Source record: 99271

"As much as I hate to rag, the 64 is fairly pathetic from a
hardware stance."

Well, as a person who once owned a 64 (and now owns a C-128 in
addition to my Ataris), I prefer the word "minimalist" to "pathetic".
<grin>

"If that machine didn't have those 4 color sprites, it would
be darn near useless."

Well, for text-based appications, it actually has some advantages over
an Atari 8-bit, owing chiefly to it's capability to put all 16 text
colors not only on screen at once, but on the same line. Also, while a
the "cell-based" graphics modes were no doubt a pain for the graphics
programmer, they were an effective "cheat" that allowed a lot more
color to be used on screen that the memory used by the screen would
allow in a true "linear" bitmapped screen. Also, I think even the
most ardent Atari 8-bitter would admit the 64 had a nice sound chip.

"The fact that it couldn't auto-boot anything,.."

True, every Commodore owner, even those only wanting to run games,
had to know how to type: LOAD "*",8,1. It would have only taken a
small change in the ROM to enable autobooting, but the 64 started
as primarily a cassette and cart based system, and Commodore seemed
unwilling to jeopordize compatibility for this small change. The
C-128 changed this (in native mode), but oddly enough, still retained
the ability to work a datasette, even in native mode!

"Also, the lack of a real XY graphics mode complicated
things further."

True. It would have been nice, if in addition to the cell-based
graphics modes it had, it had nice, clean 320x200 2-color and 160x200
4-color linearly bitmapped modes. Of course, one could also say it
would have been nice if the Atari 8-bit had a 16-color text display,
but history has had its say.

4409. Re: Ported and converted old simple fun games...

Source record: 99273

"The Gameboy I believe uses the 6502 and not a very fast
one."

Unless I am very seriously mistaken, the Gameboy actually uses a Z-80 compatible CPU, just as Sega's Game Gear does, leaving the Lynx as the only portable game system to use a 6502 CPU. (Hmmm...perhaps not, as didn't the Turbografx have a portable system, that unlike the others, used the same carts as their console)?

Stil, it does seem wrong that Nintendo would go with a Z-80 compatible CPU for the Gameboy when the NES used a 6502, and the SNES a 65816, and 6502's should cost no more than a Z-80 (or a compatible chip).

Well, all this is starting to sound more like something that belongs over in the one of the videogames newsgroups, so I shall cease and desist.

"To make a long story a little shorter - if I move the
drive forward a few inches or move it about 6 inches to
the right of the TV (and back further), it works fine.
It appears that having the back of the disk drive near the
back of my TV set wreaks havoc. Is this caused by the TV's
magnetic field?"

More specifically, it is caused by the magnetic field from the flyback transformer. I first noticed this problem back in 1985 when I worked at the Games 'n Gadgets (now Electronics Boutique) in Memphis. If we placed the 1050 to the right of the color monitor we had on the Atari 8-bit on display, it would refuse to load.

Once we discovered this, we had also found a solution to many customers' complaints their new 1050 did not work, or their new Atari computer would not load from disk, or that their software all seemed to be defective. Explaining this also saved some embarrasment for folks that would bring stuff back in "cold" (without calling), and then find when we hooked it up at our store, that it worked. Often, when we explained this effect to them, and asked them what they had near their 1050, 90% of the time it was sitting too close to the monitor's (or TV's) flyback transformer, or another disruptive field source. It was always a joy to hear from such customers the next time they came in (or in some cases, called back), that we had helped them "fix" their system without it costing a dime. (Well, unless they wanted to count the trip to the store).

4411. Using 64k in Ice-T

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-01 04:56:22 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <9408010454.AA04084@brachot.jct.ac.il>
Source record: 99275

Ice-T already uses nearly the full 48K of my base machine, and the current version, once debugged, will become the "final" 48K version.
I'll also want to create a 64k version with enhancements, that'll make use of the RAM under the OS. I'm not touching banked memory; I want compatability with as many users as I can.

I have problems with that, as a terminal program, unlikea game, is very OS-dependent. The following things are normally done by the OS.
-the system vbi
-getting keycode into 764 and managing repeat
-constantly reading the modem into a buffer (it does this in the background)
-CIO

The latter I can cope with; turning "on" the OS before a CIO call is not a problem.

VBI: Do I just turn on the OS in the immediate vb, and turn it back off (or leave it on, if I tell it it's in the middle of a CIO operation in the defferred? Isn't there a problem, that deferred vbi sometimes doesn't work?

Keyboard: There's an interrupt vector that occurs every time I press a key. How can I get it do the same as the VBI? Turn on the OS, jump to the vector, and on the way back turn it back to its previous state. The question is, how do I get it to do something every time this interrupt is finished?

Modem reader: This is a mysterious routine that constantly seems to run off interrupts while the program is running. I assume that it's part of the RAM R: handler that gets booted by the interface. Am I wrong? Does it also call the OS?

Are some of the vectors to the above-mentioned interrupts in ROM? If they are, I will have to copy them into the RAM (or change them to first turn on the OS, etc),

I need help here! Thanx for any info!

There are are of problems with the 800XL that MARS8 could have the opportunity to fix. The lack of a Freddie chip (I _assume_ that Mike is doing SOME kind of tricks to get all 4 megs ANTIC accessible). If the RAM in MARS8 will be banked in a similar or identical manner to a Newell then I would not see it as a very progressive upgrade. There have been threads on all the nets regarding bit reassignment in PORTB. We all know there simply are NOT enough bits to go around, and personally I do not like losing ANTIC banking, even though programmers don't use it much, it is one of the features I think is really neat about the Atari (for video and CPU to access 2 separate banks simultaneously). Crude VRAM of sorts.

Video was another problem, but this isn't a "must fix". Adding a socket for a 2nd PIA or Pokey would also have been possible but again, not a must. However, it is these very frills that might have been able to make MARS8 stand out as being exclusive or unique. FTE has been rather close-lipped about the banking scheme and the methods by which carts are accessed. I assume they are doing something innovative in both domains, but this is only speculation, and barring any interesting info it doesn't really prove to "hype" the system to create demand.

True. Note the "write to this register twice just in case it didn't take the first time" right out of the Programmer's Ref. Guide.

>If that machine didn't have those 4 color sprites, it would be darn near
>useless.
>
The sprites are kind of nice. I've just thought of something though. The way the 64 handles them they're just oversized characters that can be moved. (See below for an explaination).

The fact that it couldn't auto-boot anything, or come up without
>going through BASIC made it a royal pain in the a**.
>
The autobooting was a pain in the neck. It was neat when the C-128 came along and you could autoboot anything. My first C-128 hack was to have the 128 come up, switch to 64 mode and then boot something.

>Also, the lack of a real XY graphics mode complicated things further.
>
Everything on the 64 (and 128) was based on characters. The screen in graphics mode was nothing but a bunch of redefinable characters (sort of) in the way you accessed it. In 16 color mode the screen's X resolution was cut in half from 320 to 160 and each 2 dot pair could have any color almost. Each 8x8 cell on the screen had 4 bit pairs so you really had 4x8 pixels per cell. Each cell could have a maximum of 4 colors in it. This is exactly the same way that multi-colored character mode works. You cut the character size from 8x8 pixels to 4 bit pairs x 8. Sprites worked the same way color-wise but were larger.
One thing that always annoyed me about the 64 was that having the screen mode change via a raster interrupt never did a solid change. The last line of whatever mode you were switching from always flickered a bit. That never happens on the Atari during a mode change.
I would have liked to have seen an Atari with a SID chip in it. A 4 or 6 voice POKEY with all the nifty extras of a SID chip would have made an excellent computer.
I wasn't on the internet for the great wars between Atarians and CBM'ers. What were they like? What were the arguments that each side would use? I'm curious.

I disagree. You will probably isolate far more users by using the under the OS ram than you would using banked RAM. In the die-hard community, I'd wager that far more people use Sparta 3.2 exclusively than use MYDOS with no more than 64K 8-bits.

I already have to split my partitions between MYDOS and Sparta in order to use JviewXL. ANd unfortunately the gap between Sparta and MYDOS is bridged only by Sparta's ability to read MYDOS SS/SD Pfloppies.

I don't use Sparta-X because it has yet to get a MUX upgrade. I don't have my MUX active at the moment so theoretically I COULD use it but I want to wait for a version I can use permanently. Also, it's ability to read/write MYDOS is still not perfect. I think it can only read or something...

I'll do that as well if I can. However, there are several patch-type programs that don't work with 3.2g, and I'm hoping that they all access the DOS in just a few places. If I can put those locations back where they were, it will fix quite a few things at once.

It's not supposed to be a name of a density at all! Atari never made it
really clear, but what they mean when they say the 1050 is a dual density
drive, is to say that it operates in two different density modes. The
modes happen to be Single and Enhanced, and the 'dual' part only means that
it has two modes. Like a dual personality.

: More specifically, it is caused by the magnetic field from the flyback
: transformer. I first noticed this problem back in 1985 when I worked
: at the Games 'n Gadgets (now Electronics Boutique) in Memphis. If we
: placed the 1050 to the right of the color monitor we had on the Atari
: 8-bit on display, it would refuse to load.

Yes, this is exactly where I had it - to the right of the TV. As I said,
moving it up so it was away from the back of the TV fixed the problem.
It DID freak me out for a moment, though....

Thanks for the responses!

Scott

4430. PC(Linux)<--Atari Disk(SIO)

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-01 18:09:57 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1994Aug1.180957.15242@ultb.isc.rit.edu>
Source record: 99295

I've just uploaded the first pre-release of a program I wrote
to read from Atari disk drives on PC's running Linux.
This is based on the program uploaded last week that did the
same thing under DOS, and involves making a simple cable
that connects between the PC parallel port and the Atari SIO
port on the disk drive. (in fact, I used the same cable)

The real-time timers in the PC are used for all the SIO
timing, so it should work on any PC that can keep up.
(it runs fine on my 386DX/25, and hopefully works on a 16Mhz also)

It supports single and double density disks (and hopefully
enhanced, but my 1050 is dead, so I can't test it or read any
of those disks now -- does anyone have a 1050 they want to
donate to the cause? Or sell really cheap? (I'm kinda broke right now))

I used an enhanced version of the SIO2PC datafile (.ATR),
which I call ESIO2PC. This adds bad sector information to the
end of the file, so that hopefully software that depends on
bad sectors will still run under my Atari emulator (which I
plan to upload a pre-release of soon) Also, I plan to make
a reverse verison of this Parallel<-->SIO interface that allows
people to run the equivalent of SIO2PC under Linux.

It's all written in C, and should be able to be easily ported to
other operating systems besides Linux. (even DOS, probably)

Have fun.
- Frank ("Shaggy")

feb6399@ultb.isc.rit.edu

p.s.
I almost forgot: the zipfile name is: lsio001.zip
and it's on atari.archive.umich.edu
and I expected it to be transferred by the time I finished
posting this, but my connection keeps timing out, so it
may not be up there immediately, but look for it soon.

Email me with questions, comments, etc, or just to let
me know that you like the idea or find it useful and
would like more utilities like these (I write a lot of little
utilities, but this is the first time I've ever posted anything,
but with enough encouragement, I'll continue)

There was a thread going on this a few weeks ago and I missed most of it. Well, I dusted off an old disk I came across recently and it had a copy of this on it. What is this? It looks kind of like a coinop game that Atari had out a while ago....I forget the name, Vindicators or something like that. It had a graphic of a rotating planet featured prominently on the screen.

Anyway, this seems pretty cool - nice graphics. What was the deal on this? It says '(c) 1984 Atari', but I don't recall ever actually seeing anything like this come out back then. Anyone have any more info? Hints and how-tos? Can I actually buy this somewhere, or did this never see the light of day?

Thanks.....

Sydtech

Well, time to beg again.... (someone please come up with something,
this is getting old :-(!)

Again, I'm looking for information on how to low level format a MFM drive
controlled by a Xebec bridgeboard connected to the Z-tec 1000 piggyback
board for the ATR8000. I have several formatters, all of them simply lock
up the ATR8000... I don't know if they need to be given addresses to work,
or there is some bad hardware, or what... (and of course, I have no docs
on the Zetec-1000 or the Xebec bridgeboard)....

Alternately if someone has a SASI board and software for an IBM PC, (since
I believe the Z-tec 50 bin buss is SASI.... or SCSI, but I would guess
SASI), what do you want for it so I can low level format the MFM drive through
the Z-tec....

Someone must know something somewhere... I know of another Atarian who has
almost the same setup as me and is in the same predicament... someone must
know someone somewhere..... or how to contact the developers of the z-tec
kit or something....

SOMEBODY PLEASE HELP..... I'm getting sick of using that hardware to hold
my bedroom door open (just joking!)....

Anxiously awaiting (but not holding my breath),

SUPER ATARI STacy DEAL!

The Atari STacy is a portable Mega ST with all the standard Atari
ports plus a built in monochrome monitor.

At the recent Mid-Indiana ST AtariFest VI, an Atari 4/20 STacy with
a special MIDI box and sequencing software was seen for sale at $1700.

The June 1994 Toad Computers flier advertises Atari 4/20 STacys for
$1400.

I am selling my STacy for a price below either of these prices and
you get so much more:

4 MB of memory
130 MB Maxtor HD
16 MHz AdSpeed CPU
Port for Mega ST keyboard (something no other STacy has)

Plus these items:

Joypad
Padded carry case (very nice)
External Mega STe keyboard (best keyboard ever made)

All for only $1000 plus S&H (US only, please).

Contact at (614) 262-2396 or jpoling@magnus.acs.ohio-state.edu

Source record: 99225

Okay. It's finally uploaded to atari.archive.umich.edu.

The file is: psiox002.zip (Parallel SIO Xfer)

For those that missed the previous message, it allows
people with PC's running Linux to hook up Atari disk
drives to the Parallel port, and read them into
an ESIO2PC file. An ESIO2PC file is the same as
as SIO2PC file with a table of bad sector info
tacked onto the end (and the last reserved word of
the header is used to tell how many bad sectors
there are)

It should be easy to port to any other OS that
runs on the PC that allows you to lock out
interrupts (it needs precision timing while
talking to the drive)
Please note: due to this, your clock could
lose a few seconds every time you use this
utility.

Note: My emulator (which I'm trying to get ready
for a pre-release right now) will be supporting
the ESIO2PC format, so that disks with bad sectors
will be properly emulated.

4441. C++ and ASM Atari emulator source code

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-02 03:38:41 UTC
From: munoz@paris.utdallas.edu
Message-ID: <MUNOZ.94Aug1223841@paris.utdallas.edu>
Source record: 99304

As promised, I have uploaded the source code for both the c++ and
80x86 assembler version of my Atari Emulator. The c++ emulator
has only the text mode and is very slooooooow. The assembled version
has all of the graphics modes and one scan line player graphics.
If you are interested in how an Atari emulator works or want to
write your own, this program is worth a look.
I uploaded both emulators under one name "atariemu.zip" onto umich
today.

have fun,

Mike Munoz

I'd love it if someone knew the answer to this one; I've been looking for
that game for a few years now. There was a place that advertised in the
AC classifieds claiming to have something like 1800+ games, so I figured
they'd have it. They did, but it was a pirate shop so I didn't order it.

I ran BBS Express Pro for about 5 or 6 years and it is an excellent system. It's predecessor, BBS Express 850 is available free. It's more limited in scope and speed, but it will run without any major problems.

Express Pro was purchased by KP products some years ago, but the version I ran was the original from Orion Micro (Keith Ledbetter). I think it was version 2.0c. Anyway, you might want to check that out.

Message-ID: <31l9di$hkc@usenet.INS.CWRU.Edu>
Source record: 99224

Hi,

Previously, I'd posted that I couldn't get my 320k 130xe with
1meg MIO running SpartaDos 3.2g from a Ramdisk to run the ICET
program. Well, last night, I got it working. All I had to do
was to issue the KEY OFF command, and it works perfectly, as
well as Flickerterm80. Now BOTH programs run on both of my
systems. The other system is a more conventional 1meg 1200xl
with Atari 850 interface. I have to use the Sparta RS232.COM
with this setup FIRST, but otherwise, no other problems.

FINALLY ... he said with relief!

Bill

4452. Need help recovering my software

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-02 12:27:07 UTC
From: davegan@panix.com
Message-ID: <31le2r$232@panix.com>
Source record: 99229

Here's the deal. In 1979-1983 I was a high school kid with my first computer (Atari 800) and found myself in the midst fo an exploding software market. I collected everything that was available for the Atari. To cut to the chase, after reading this group for a bit, I missed my 8 bit, and, no longer being near my mom's house (where the computer was), I got an 800XL system. I finally got to my mom's house this summer and wanted to get my boxes of software (about 750 floppies, as I recall) only to discover they were all gone! I was one unhappy camper, adn my mom was pretty upset as well. It seems a few years back my sister's boyfriend managed to take quite a bit out of the house (the contents of a liquor cabinet, a darkroom. etc.)

The bottom line is I would love to find a way to recover my software collection. Games like Jumpman, Hard Hat Mack and Jawbreaker are becoming recurring dreams. I am trying to find someone in or near NYC who can sympathize with an old collector and assist him in software recovery. I am a nice guy, and am open to all suggestions for how this might work. Another missed game K-razy Shoot-out.

Thanks,
Dave

: There was a thread going on this a few weeks ago and I missed most of
: it. Well, I dusted off an old disk I came across recently and it had a
: copy of this on it. What is this?

There was a film called The Last Starfighter a few years ago (I've never seen it myself), and this was supposed to be the game of that film. For some reason (Copyright problems or something) it was never released at the time. But... there is an official version available, and it's called.. Star Raiders 2! SR2 is simply a suitably modified version of The Last Starfighter, with a different storyline. However, some people reckon TLS is bettr than SR2.

: Anyway, this seems pretty cool - nice graphics. What was the deal on
: this? It says '(c) 1984 Atari', but I don't recall ever actually seeing
: anything like this come out back then. Anyone have any more info?

Well, now you know why you don't remember it- it was never officially released! This is all stuff I've heard from other sources by the way, since I don't own SR2 or TLS, only the original Star Raiders. The concencus seems to be that good though SR2 is, it isn't as good as SR1. I wonder how much better TSL is than SR2 though....

- Graeme Fenwick. No sig as such at the moment- email me at gfenwick@mcs.dundee.ac.uk

: copy of this on it. What is this? It looks kind of like a coinop game
: that Atari had out a while ago....I forget the name, Vindicators or
: something like that. It had a graphic of a rotating planet featured
: prominently on the screen.

"Vindicators" was a vertically-scrolling 2 tank game. You would drive around and shoot things, pick up stars (which could be exchanged for gun power, gun rotation, fuel, etc), and try not to run out of gas. It wasn't really flashy, but it was one of those games you can really get into. There's a coinop, and a decent version for the NES, but not for the 8-bit, I think.

And no rotating planet, that I remember.

4455. Re: The Atari 14xx Series

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-02 15:14:00 UTC
From: heller@belair.cse.psu.edu
Message-ID: <31lnro$k7o@psuvax1.cse.psu.edu>
Source record: 99231

Is there any "physical" way of determining which 14xx boards
have functioning PBI's?

And why don't some of them work? Is this because Atari designed (ahahah)
the 14xx first after the 1200xl and then went on to the 600xl/800xl boards?

Andrew

Oh, and does Ben still have his for sale or did someone sneak a deal?

>can be quite tricky, but can be done... though I find little need, unless
>you plan on writing your own drivers. The location should be independent
>of the DOS you are using since these are OS functions.

I just want to be able to read and write to a sector in a ramdisk
or a harddrive, without rewriting the handler. I don't want to
use CIO.

>> Also, what I have to do to recognize a disk to be in MyDOS format?
>> A flag in some sector? 360? How can I know the sector size before
>> reading?

>ASAIK, the MyDOS format is VERY similar to AtariDOS 2.5; just a 'superset'.
>I.e., If you format a disk in single or enhanced density under MyDOS, DOS 2.5
>should have no problems, providing that you don't use any subdirectories.

DOS 2.5 has to be hacked to read files stored in MyDOS disks, or
an ERROR 164 would appear, especially if enhanced density is used.
I was thinking of a byte (or more) which I can read from ANY diskette
to say if it is formated with MyDOS, and the size of it.
By now, I'm reading sector 360, bytes 2 and 3.

>I could check the tech. docs to be see if there is a flag somewhere.

I've checked the manuals... no success...

>re: Sector size. [...deleted...]
>I've written code to return the sector size, free sectors, and aprox. free
>bytes using the above method. It works under AtariDOS, MyDOS, and SpartaDOS.
>I could post (it's short) or e-mail you a copy if you like.

I'm waiting for that code :-)

Also, I read somewhere that BlackBox support 512-byte sectors on hd.
Are those sectors handled by the BB to simulate 2 256-byte sectors?

>> One more. A double density disk has only 4 sectors for the main
>> directory (and each subdir) ???

>I'm not sure what you are asking.

Each dir can contain (64 files)*(16 bytes of info) = (1024 bytes) =
(8 SD sectors) = (4 DD sectors???)

>Two resources that are a must. "Mapping the Atari - XL/XE version" and the

I already have it... Is great :-)

4466. Help fixing 1050 drive

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-02 22:09:43 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1994Aug2.220943.26873@ultb.isc.rit.edu>
Source record: 99251

I need help fixing a 1050 disk drive that died-- I think
it's something simple, but I'm not sure.

While working on my program for reading Atari disk drives
on the PC parallel port, I redisovered something I probably
knew a long time ago-- My TRAK drive can read single and
double density disks, but not the enhanced format.
(although it seems to read the first 720 sectors as
if they were double density, with FF for the second
128 bytes in the sector)

So, I hooked up my old 1050 which didn't work anymore,
to see if I could figure out what was wrong. Since I now
had full contol of the SIO stuff I could see exactly
what was going on---- well, whenever I try to read
sectors from the disk, it responds with a NAK. It
doesn't even attempt to do the read, it just gives
a NAK, as if I had tried to read some sector that
wasn't valid, or I sent an invalid code or something.

Any idea what would cause this? Perhaps the drive
thinks it's not ready to read sectors yet, like it's
not done initializing or doesn't think it's up
to speed or something? I heard something once about
burnt out sensors-- could someone repeat the info
about that and tell me if this could be caused by
that?
Thanks.

(or could someone donate or sell me a 1050 really
cheap???)

-Frank

Yes, because although it IS possible to write a DOS that supports 512 byte or 1K byte sectors, NONE exist at this date. Bob Woolley wrote a custom 1k byte sector handler for his IDE interface on the 1200XL for instance. There is an OS location for sector size, but I don't know how much that is used.

The Gameboy can't have more than 320 horizontal. It is rather trivial to extend the vertical resolution, just use up the border area. FlickerTerm did this. Most modern TVs and monitors have enough vertical bandwidth to go up to 205-210 lines vs. the standard 192. You can't (as far as I know) extend the resolution using horizontal overscan.

Hey.. from this "possibility" to read 512byte and 1024byte sectors on an Atari, wouldn't it also be possible to read CD ROM disks via a SCSI CD ROM drive!? I mean, sure there's not TOO much we could get use out of on CD ROM's, but there are those big 'collections' disks.. GIFs, WAVs, MODs, PD Software (people with 8bit BBSes could very easily support the IBM dweebs by hooking up some IBM PD CD ROM and leaving their HD space for Atari stuff and personal use! :))

Too far fetched? I don't think so! We should write software which is compatible with one of those CD ROM encyclopedias or something! Heh!
PS- need an MPEG viewer for MSDOS :)

Glenn said: "You can't (as far as I know) extend the resolution using
horizontal overscan."

Ummm... :) Glenn, if you're thinking what I think you're thinking, then try
this:

POKE 559,35

also try:

POKE 559,33

and back to normal ... POKE 559,34

:)

Once again for all: I think KE-Soft in Germany (see vendorlist) still
sells German 800 XE's for 229DM (i.e. about $150 + p&p). But be sure,
that you have a TV which is able to display PAL!

Bye,
Jochen

4477. ML Plot routines

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-03 07:31:31 UTC
From: cp576@cleveland.Freenet.Edu
Message-ID: <31nh4j$f9f@usenet.INS.CWRU.Edu>
Source record: 99249

Here is the source code for ML plot point routines for
2 color, 4 color, and 16 color modes.
They use tables to rapidly plot points, although on a
graphics 8 or 15 type screen this will use 384 bytes of
memory I feel the speed is worth it. The tables can be
built by a routine such as the following one if you let
the OS set up the screen.

```
inittab
lda 88
sta ztmp
lda 89
sta ztmp+1
ldy #192
loopinit
lda ztmp
sta stabl,y
lda ztmp+1
sta stabh,y
clc
lda ztmp
adc #40
sta ztmp
bcc *+2+2
inc ztmp+1
dey
bne loopinit
rts
```

If you set up the screen yourself you can define the
table in your assembly.

```
stabl db low [screen+0*40]
db low [screen+1*40]
db low [screen+2*40]
...
db low [screen+191*40]

stabh
db high [screen+0*40]
db high [screen+1*40]
...
db high [screen+191*40]
```

This is a lot of typing though.

```
In my own assembler I use:
stabl echo 192
db low [screen+%i*40]
endm
stabh echo 192
db high [screen+%i*40]
endm

In all of the above examples change the 40 to 20 or
10 as appropriate for lower graphics modes.

If there is interest I can post line, frame, box,
circle, and solid circle routines.

---------------- cut ---------------

;change these to desired z-page locs
;patadr is used only by 2 color pattern
; plot routine
patadr equ 203 ;2 bytes
ztmp equ 205 ;2 bytes
ztmp0 equ 207 ;1 byte

;These are two tables that contain the
;start address of each screen line.
;They can be defined at assembly time
;or have an initialize routine do it
;for you. stabl holds the low portion
;stabh holds the high portion. Without
;these table the plot routines need to
;multiply by 40 and add in the start of
;the screen. You can also use any
;graphics mode, or even mixed modes if
;the table is properly set up.

stabl ds 192 ;can be increased or decreased

FOR SALE - ATARI 8-BIT SOFTWARE

MicroProse titles:

F-15 Strike Eagle & Silent Service $5.00/each

SSI Titles:

Computer Ambush, Panzer Grenadier, Reforger '88 $5.00/each or
all 3 for $12.50

Various titles:

Get Rich! Insurance Planning (Arrays Software), Megafont II/II+/Font Simulator
Package (XLent Software), Winter Challenge $5.00/each or all 3 for $12.50

FOR SALE - ATARI 2600 CARTS

Crystal Castles, Ms. Pac Man, Realsports Football, Space Invaders, Venture
$3/each

FOR SALE - ATARI 7800 CARTS

Asteroids, Ballblazer, Choplifter!, Crossbow, Dark Chambers, Dig Dug,
Food Fight, Jinks, Joust, Karateka, One-On-One Basketball, Pole Position II,
Realsports Baseball, Robotron:2084, Xevious, Centipede $5/each or 5 for $20

Dark Chambers (cart only) and Karateka (cart only) $3/each or both for $5

All items are brand new in original boxes.

All prices include shipping. Multiple quantities may be available for some
2600/7800 titles. If interested, contact Lawrence Estep at 71450,1050 on
CompuServe or 71450.1050@COMPUSERVE.COM on Internet.

4480. Re: Need help recovering my software

Source record: 99155

In article 232@panix.com, davegan@panix.com (David Stein) writes:
>In 1979-1983 I was a high school kid with my first computer (Atari 800)

>I collected everything that was available for the Atari. [...]
>and wanted to get my boxes of software (about 750 floppies, as I recall)

Hmmm... as a high school kid with 750 floppies of software, you must
have spent every dime of your allowance buying all those programs, eh?

>The bottom line is I would love to find a way to recover my software
>collection.

Personally, I'd love to find a way to make people realize that software
piracy is illegal, morally wrong, and damaging to us all!

>I am a nice guy, and am open to all suggestions for how this might work.

Yeh, our jails are full of thieves and other 'nice guys,' too.

Rationalizing the acqusition of copies of commercial software from
publishers long dead is one thing...blatant pleas such as this one for
help in rebuilding one's software 'collection' is quite another.

Just my $.02. But you might stop to consider what few remaining Atari
developers think when they read public statements such as this.

-Hutch- @ Fair Dinkum Tech

(David Stein wants to recover his 8-bit software collection.)
Dave,
1. Don't let your sister's boyfriends come near your closets.
2. Find the old buddys where you got the software in the first place.
3. Try reading the Vendor List and calling some of the vendors.
Like, turn over a new leaf. Jumpman Junior, Hard Hat Mack,
and maybe more of your favorites, are, believe it or not available
from American Technavision, B & C ComputerVisions and/or Best
vendors, see the vendor list. And available for like $14, $10.
4. Find out some more about what's going on with great developments
from FTe and CSS (see vendor list.)

4489. TV'S VERSUS 1050'S

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-04 06:16:24 UTC
From: b.poehland@genie.geis.com
Message-ID: <199408040615.AA103660951@relay2.geis.com>
Source record: 99165

TV's versus 1050's

When I got my first 8-bit system back in 1984 I returned several 1050's to Electronics Boutique & Kiddie City as defective. I had my monitor sitting ON TOP OF THE DRIVES (!). It was quite some time before I realized why the drives were "failing" so much (I recall one particularly bad day when I very nearly pitched a 1050 into the back yard).

Yes, absolutely, the flyback transformer in the TV/monitor is the culprit. TV's & analog monitors put out a very strong 15.7KHz electromagnetic field. Very close to the average speed rating of the Atari SIO (which is rated at 19.2KBd but actually runs somewhat slower).

I experimented extensively with methods of shielding, including one 1050 with a thick piece of grounded iron plate mounted under the top case. Made an impressive paperweight, but didn't stop the RFI from messing up the drive.

More effective was a big sheet of grounded steel plate placed under the monitor. I'm still using this today, in fact have it resting on top of my bank of four 3.5" PBI drives attached to my BB/FB. Works reasonably well as long as the drives are at least 1" from the edge of the protective metal barrier.

Most effective of all was to open up the monitor & wrap the flyback in thin tin-plated steel sheet. Soldered in place with a ground attached (anything tin-plated will solder OK). Tried this with a green Apple-II monitor, it worked fine. Cut down the radiations by maybe 95%. The steel sheet is available at hobby shops. I gave similar treatment to a Heath/ Zenith analog monitor, with similar results. These results are in agree- ment with the general rule for ALL RFI problems: A millimeter of shielding at the SOURCE of RFI emissions is worth a foot of shielding at the site of the problem.

Presently I'm using a converted Digital Rainbow/VT 220 paperwhite mono monitor. It doesn't have a shielded flyback but does have the entire interior of the plastic case enclosed in grounded copper foil. Copper isn't quite as good a shield, as it is only paramagnetic. The best shielding is with a ferromagnetic metal such as iron or cobalt or alloy of those (like the stuff used to make speaker magnets).

I also have an old PSI amber mono monitor with a steel case-- that sucker never radiates. But once, the case came in contact with a speaker magnet & got magnetized. The display was totally bizarre but became normal as soon as the case was removed. I demagnetized the case with a bulk audio tape eraser. It works great (I keep that one on my test bench).

Ben,

1) Can I visit you!? I wanna see all of your keen hardware! :) :)

2) Why don't TVs/monitors come PREMADE like that!? (with sheilding)

3) My 1050's been acting up a little more lately.. guess where it is!?
BUT.. it's BEEN there for a while.. of course, I have rotated the
TV around a little bit. It of course also could be the disk (I have
a MyDOS disk I still use when I don't wanna boot up the old PofS/2
and run SIO2PC.. SIO2PC's fast but if I just need to boot up the XL
and run TurboBASIC, the XL can have that done before the PC's got
SIO2PC loaded! :)) (why am I smiling!? I HATE that!)

My main serious question is #2 .. wait.. is #3 a question? I guess not :)

You have a modem, a hard drive, and an 800XL and wish to know about ATARI BBS systems. Well, I don't know much about ATARI 8-BIT BBSes, but here is everything I know about:

1.) BBS EXPRESS-PROFESSIONAL! (also known as "PRO!")

If you want to purchase a BBS package, this seems to be the way to go. I understand that this BBS is made of compiled ACTION! language object code. This BBS does networking and has boards in Canada and Europe. This BBS supports online games. (The only drawback to this system that I know about was a rumour on the network several years ago that if you "badmouthed" the authors who now support the code that they could call up your BBS and inactivate it with a remote command. I've never heard of such a case directly happening. The rumours could have been started by competing software authors, or they could be one of those computer folk legends you hear of from time to time.) "PRO!" is the best ATARI BBS up to this time and has been continuously improved and worked on up until this very day. I believe that the code to run the BBS is written in compiled ACTION!, so that no special language cartridges are neede to run the BBS.

2.) The BBS Express (also known as "Express BBS")

Express-BBS is the public domain version of BBS EXPRESS-PRO! I do not believe that it is capable of supporting networking. This program is the "demo" version of BBS EXPRESS-PRO! that you can run to try out the basic features of the BBS before you send away for the commercial version. I haven't seen this program available for downloading in the Boston, Massachusetts, USA, area. (I may have missed it but it doesn't seem to be on many boards.)

3.) FOREM-XE

FOREM-XE is a public domain BBS that requires the BASIC-XE cartridge in order to be able to run it. FOREM-XE has the capability to network with BBS EXPRESS-PROFESSIONAL! boards via a "cross-net" module. While EXPRESS-PROFESSIONAL! is the most popular ATARI 8-BIT BBS, I think it can be argued that FOREM-XE is the second most popular ATARI 8-BIT BBS.

4.) CARINA

CARINA is an interesting BBS in that it is written almost entirely in BASIC. It runs almost like a command shell with program module overlays. Because it is written in interpeted BASIC I am not entirely sure how stable it is. CARINA allows for networking. CARINA also allows you to run the BASIC environment remotely, which means that you can run a slave terminal remotely off the modem and program in ATARI BASIC in eighty columns off of the modem port. If you are into BASIC programming it

makes a nice hobbiest board.

5.) OASIS JUNIOR III

This is an interesting little BBS. OASIS JUNIOR III is a public domain BBS. It is the "demo" version of OASIS IV. OASIS JUNIOR III is written entirely in assembly language, so it is very stable. OASIS JUNIOR III also comes with a built-in terminal screen with which you can manually dial out to perform uploading and downloading without having to clear the BBS software or reboot the machine. OASIS JUNIOR III also has a control key toggle (CONTROL-N ? CONTROL-T ?) so that you can upload "wide" messages into the message base without the message being wrapped at forty columns. The message bases on OASIS JUNIOR III are very well done. Unfortunately, the file download area of OASIS JUNIOR III is very confusing. Download areas are arranged not by logical directory but by "library types". What this means in a parallel example is that it is like if you had ".DOC", ".TXT" and ".OBJ" files all on "D1:", you would have to list "D1:" --THREE TIMES--, once for ".DOC", once for ".TXT", and once for ".OBJ" ! (Well, not exactly, but something close to it.) Having twenty partitions on a single floppy drive is a bit ridiculous. On a large hard drive the system would work fairly well, but on a floppy you would be issuing file command after file command only to view one or two file entries at a time. OASIS JUNIOR III does not network (see: OASIS IV). (Note about OASIS JUNIOR III -- All of the file MESS.DAT which contains the BBS prompts, has to fit into memory at once. On a stock 800XL you have to edit down the prompts so that they will fit into memory. Someone has already done this. Otherwise the program will lockup when loading.)

6.) OASIS IV

OASIS IV supports networking. I assume that OASIS IV works much the same way OASIS JUNIOR III does. I don't know what became of OASIS IV as all work seemed to be halted on it once myself and other callers to OASIS BBSes made disparaging comments about how difficult the OASIS file libraries were to use. We were called ungrateful Atarians (which we were). Work in the USA was halted and the program was sold to someone overseas.

Here are some of the older BBS programs:

7.) NITE-LITE

Paul Swanson's NITE-LITE is the forerunner of today's MichTron and NITE-LITE ST BBSes. NITE-LITE BBS was the first ATARI 8-BIT program of which I am aware that used a RAM disk. I believe these were known as "V:" devices (for virtual disk) and later as "M:" devices??? (for memory disk?) Nite-Lite was written in BASIC and some assembly language(?) and had a very good message editor, one of the best. Its file areas were also easy to use. I am not sure of the status of NITE-LITE, if it is still commercial or in the public domain (the ATARI 8-BIT version, that is). NITE-LITE was very popular around the Boston, Massachusetts, USA, area.

8.) AT-KEEP

AT-KEEP is the ATARI 8-BIT version of the popular CITADEL "room based" BBS program. AT-KEEP is in the public domain and is written -- I believe -- in BASIC-XE. From what I understand, AT-KEEP was popular in the Loiusiana, USA, area of the world.

9.) Marco Benton's "PROFESSIONAL BBS" (or was it called "SMARTBBS")

This BBS is written entirely in BASIC and makes calls to SPARTADOS. Instead of using the R-TIME-8 cartridge clock device "Z:" handler, the BBS makes calls to the clock register on an external modem? This BBS is in the public domain. There is supposedly a commercial version of this program available. (It was tough trying to figure out how this BBS worked, but maybe now that SPARTADOS has gone public it may be worth another attempt.)

10.) F.O.R.E.M. (Friends of Rick E. Moose)

F.O.R.E.M. is the grand-daddy of the program FOREM-XE. Unlike FOREM-XE, however, F.O.R.E.M. is written in ATARI BASIC. F.O.R.E.M. can best be succinctly described as "...the closet thing to Ward Christensen's RBBS that had ever been written for the ATARI 8-BIT."

11.) The ACS BBS (also known as ANTIC BBS)

The ANTIC "BBS Construction Set" program is another old BBS program. This BBS can best be described as full of bugs, however the BBS featured a very nice type-over, intra-line editor that made entering messages a pleasure. Whether or not these messages would be saved was another matter entirely.

12.) A.M.I.S. BBS (ATARI Message Information Service)

This is the earliest ATARI BBS ever written? I think it was written by M.A.C.E., the Michigan ATARI Computer Enthusiasts club. This BBS program is so old that it comes with instructions on how to build a RING detector circuit for your modem, since public modems were not expected to answer the phone! (Now that's old!) This program is so old that you are expected to use a disk sector/hex-code editor to manually allocate each byte of disk sector space for individual messages. I mean to say... this program is --OLD-- ! (I understand that there is a program --EVEN OLDER-- than A.M.I.S., which was mentioned in COMP.SYS.ATARI.8BIT recently!) Needless to say, A.M.I.S. has been modified about three hundred times or so over the years. I wouldn't know where you could obtain the last incarnation of it, or if you would even want the program if you could find it....

Well, that is all the ATARI 8-BIT BBS programs that I know about. I hope I haven't left any out by mistake. If so, I apologize.

>the 1450, there is a small B&W picture in the Best Electronics catalog.
>You may want to get the catalog. There are other incarnations of this
>famous publicity photo but I don't know of any offhand.
>

I can remember getting a copy of the Maplin Electronics magazine with news of the new Atari machines in the summer of 1983. There was a photo of a 1450XLD in that - I have never quite shaken the desire to have one since that day. I still have the magazine at home somewhere. Unfortunately, the photo was only b&w, but the specs listed were awesome at the time, because I only had a 400!

Geoff

(Maplin Electronics is a major electronics supplier in the UK, and as far as I can remember were involved somehow in the UK Independent Atari User Group. I think they were one of the first companies to import the 400 & 800 to the UK)

... Any resemblance between the above views and those of my employer, my terminal, or the view out my window are purely coincidental. Any resemblance between the above and my own views is non-deterministic. The question of the existence of views in the absence of anyone to hold them is left as an exercise for the reader. The question of the existence of the reader is left as an exercise for the second god coefficient. (A discussion of non-orthogonal, non-integral polytheism is beyond the scope of this article.)

4494. WANTED: 256K Rambo upgrade or 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-04 15:26:15 UTC
From: tom@ready.rsip.lsu.edu
Message-ID: <31r1an$sb@monk.rsip.lsu.edu>
Source record: 99181

I've got a copy of Bounty Bob on disk and it only runs on 64k machines (so it says). However, when I run it on my 800xl, it gets to the screen where you select the cheat options, and locks up there with no where to go. The person who sent it to me has a rambo 256k upgraded 800xl, and mine is just a plain 800xl (I think). So, where can I get the rambo upgrade and for how much, or will it work just as well with a 130XE and if so is someone selling one?

Email responses if possible.

Thanks

>>>Buying software from "retiring" 8-bitters is an easy way to hit a
>>>motherlode the legal way. That's my best advice.
>>
Another good source of legitimate software is TOAD Computers. While
known primarily as an Atari ST source, they have quite a collection of
recycled 8bit software. Their latest catalog, which just came the
other day, has one page listing over 600 8bit items. I've bought
from them in the past and been quite satisfied. Their information
number is (410) 544-6943 and their order number is (800) 448-8623.

4497. Newell 256k help?

Source record: 99169

I have a Newell 256k board that a friend gave me a long time ago, but
no documentation. My RAMbo combatable hack upgrade (a friend of mine
built years ago) seems to have died. Instead of fixing it, I just want to
install the Newell.... but I have some questions:

- RA8 no problem

- PB2 What PIA pin numbers
- PB3 and do they get bent
- PB4 up out of there
- PB5 sockets like the
- PB6 RAMbo.

- DEL Where?

- HALT Where?

Since there is no labeling on the hack job, I don't know what is really
going where.

Also, what are the differences between the way a Newell and a RAMbo
do banking.

thanks....

-Adam Conover.
a644690c@edinboro.edu

PS. **** MY MACHINE IS DEAD UNTIL I GET THIS FIXED ****
So.... anyone I have promised code to will have to wait... sorry..
Also, I think the MIO problems I've been having *may* have been
caused by the flakey RAMbo. (That I didn't even know existed until
a couple of days ago!)

HEY! Nice review of Atari 8-bit BBSes! I wrote a BBS which I'll one day
(soon probably) release. (I have to reproofread the docs, and ARC it all up.) It's called
"MyBBS" and runs well under MyDOS. The current version I have needs
an Action! cartridge, but that's easy to fix by recompiling it all. It
supports external programs, a nice message base, no file area (I'm sure if
anyone CARED, they could write that as a door), and is mainly a text/info/
message BBS. I had it up and running on and off (whenever nobody else wa
s using the phone :)) with an Atari 1200xl with two 1050's and an SX212.
I'll put it back up soon with my 256k 1200xl, an R:P:Connection, and see if
the sucker can pump out 14.4k! :) :) :) (Also, I'll have it SIO2PC'd, so
that way I can maybe support ANSI-80-column instead of just ASCII-40-column.)

Anyways.. that was a cool message! Bravo! :)

(Gees I forgot the name, wants to know pin connections for Newell
now FTe 256k upgrade.)
I'm sure I'm not doing FTe a favor, but here's the pin connections.
You got a 14 pin ribbon cable with one wire red.
1. (red) to antic pin 9
2. 74LS51 pin 9
3. Ram chip pin 1 (inside most of r32, common with drams.)
4. Antic pin 8
5. cas out 74LS51 hole 8
6. CAS in 74LS51 pin 8 (hmm... both to same pin, seems so.)
7. nc
8. nc
9. nc
10. pia pin 12
11. pia pin 13
12 pia pin 14
13. pia pin15
14. pia pin 16
No pins need be bent up.
if you have the 130xe Antic (co21697, 4,5 and 6 need not be connected)

4504. APOLOGY OWED TO JEFF MCWI

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-04 22:09:06 UTC
From: pab@cnx.sccsi.com
Message-ID: <e03_9408050316@cnx.com>
Source record: 99103

I was having a cup of tea when my log told me that
B.POEHLAND@GENIE.GEIS.COM said to ALL...

B>Both Jeff & I made a serious effort to interest Pab in supporting AC as a
B>subscriber & as an author. Pab refused on both counts. Pab failed to
B>mention that in his recent post.

To clear up the record here:

(1) You'll also notice that I did not subscribe to Current Notes. Or to any other magazines, except for "Newsweek" which I got through a SUBSTANTAL discount through my employer at the time. I was (and still am) living a hand-to-mouth existence. Money for magazine subscriptions was out of the question. I won't get into the quality of the publication.

(2) Submissions were also right out. The amount of my free time that went into what I DID give to the 8-bit community was substantial, and I did not have any more time to spare. My total number of submissions to any 8-bit magazine was one: an article specifically requested from me by the 8-bit editor of CN. I would have loved to do more, in fact I had (note: had) a twelve-part series on advanced programming in Action! sitting on my hard drive. But I won't get into the pulling teeth that went into getting writers' guidelines from AC.

B>To see Pab then turn around & attack Jeff in a public forum like this is
B>really
B>quite dreadful. I must protest Pab's mean-spirited treatment of
B>Jeff in the
B>strongest possilbe terms.

My intention was not to attack Jeff. If it came across that way, I am very sorry. It took a lot of effort on Jeff's part to launch the campaign to start AC. (If he checks his records, he'll also notice I did not send back his 'support' card because I could not afford to pay what he wanted us to 'pledge.' I was not one of the invisible thousands who snuck out of the back door when the time came to put money where their mouth was: I never put my mouth there.)

My point is that AC proved something that had to be driven home to me: the support for the Atari 8-bit is nil. Other than a few dedicated souls (most of whom are the people on this group right now), people don't care. The futility of being a shareware author for the Atari was also pointed out to me not only by my own experiences, but those of other authors. And don't even get me started on the debacle of FTE. The self-destruction-beyond-even-Bob-Puff's-repair of my 320XE most

likely hastened, not caused, my departure from the 8-bit programming world.

B>Pab, you owe Jeff McWilliams a BIG apology!

B>Are you man enough to do it?

Jeff McWilliams has any apology, and any style of apology, he feels himself deserving of. Are you man enough to admit that AC was a mistake?

Half naked and half sedated, KENDRICK@SONOMA.EDU ran through the streets screaming something about "MyDOS CLI in the works ag...."

K>And this time I know what I'm doing .. sorta :)

Care for some tips from someone who was working on one when the blue smoke that makes the computer run started escaping?

K>I'm just curious.. where's a good place to store parameters?

A MYDOS CLI would really be worthless unless it emulated SpartaDOS's style. Most programs which use command lines use the OSXL+/SpartaDOS method of passing, and you would be best off working with something that could pass commands to the CLI.

Here's my suggestions:

(1) Use a bank of RAM for the CLI itself and related programs. C3 would be the most likely bank, since it's the lowest of the "non-130 banks." Switch in the bank, run the routines as needed, and bank out. Use an ML routine which would get the address to run from the X/Y registers, for example. This routine would best be kept in low memory.

(2) The way SpartaDOS handles its information is with something called "COMTAB," the command table. It's centered around the address stored in $0A. $0A points to a JMP command to run the CLI, and information is referenced in relation to that location. Study the way SDX does it (it's in one of the appendices of the SDX manual, or I can send you as much data as you need) and try to come close.

Granted, this requires machines larger than 64K, but most nowadays are, and puts to shame the people who are complaining about 'no banked applications.' <grin, I was one of them> And you can do a lot more with a 16K CLI resident at all times than you could with one loaded like a DUP.SYS.

Quoting F TOONED (God knows why):

FT>Should FTe drop the MARS 8 project?

No. If you can carry it until it takes off, go for it.

FT>Is a 65816 processor really worth the time and effort?

Mmmmm. It has possibilities. Unless you completely replace ANTIC,
GTIA, and POKEY so the system can run faster than 1.79MHz, it might be a
waste.

FT>Is 4mb of memory support a waste due to lack of software?

Not if you come up with a reliable banking method, and publish specs so
third-party people can develop for it. I know I would have LOVED to
play around with 4M in programming.

William Kendrick (kendrick@zippy.sonoma.edu) wrote:
: HEY! Nice review of Atari 8-bit BBSes! I wrote a BBS which I'll one day
: (soon probably) release. (I have to reproofread the docs, and ARC it all up.) It's called "MyBBS" and runs well under MyDOS. The current version I have needs
: an Action! cartridge, but that's easy to fix by recompiling it all. It
: supports external programs, a nice message base, no file area (I'm sure if
: anyone CARED, they could write that as a door), and is mainly a text/info/
: message BBS. I had it up and running on and off (whenever nobody else wa
: s using the phone :)) with an Atari 1200xl with two 1050's and an SX212.
: I'll put it back up soon with my 256k 1200xl, an R:P:Connection, and see if
: the sucker can pump out 14.4k! :) :) :) (Also, I'll have it SIO2PC'd, so
: that way I can maybe support ANSI-80-column instead of just ASCII-40-column.)

: Anyways.. that was a cool message! Bravo! :)

If you can keep the core small and have it support 14.4 I might consider using it. I've grown a little tired of running a conventinal board, and might want to run an online-game board instead. Something very simple which just manages accounts and has enough room for modular code IN THE BANK WINDOW (nudge nudge) with a little leftover.

You know, the benefit of using MYDOS vs. SpartaDOS diskbased, is that you can potentially use the memory under the OS for your core and preserve all standard memory for modules. You can NOT do this with PRO!.

Hello all...

Please help me! A few years ago (I think '83/'84) Antic magazine published a few articles about how to control servos with an Atari. If any of you might have these magazines, PLEASE respond! I need these articles. I will even pay for them! I can be reached at btallis@cv.hp.com or (503)715-2129. Thank you for your help...

From: kendrick@zippy.sonoma.edu
Message-ID: <31s0k0$484@nic-nac.CSU.net>
Source record: 99180

Hah! Haha! Sorry :) The code is too 'old' for me to make any major hacks.
You'd hate it I'm sure.. I lived with it because I was able to baby it along.
(I was always in the room when somebody logged on.) It does NOT detect
dropped carriers! :((I dunno HOW! Wheres the "Carrier Detect" bit for
R: handlers like the SX212's!?!?!) I also dunno if it can work at 14.4k! :)

BUT.. you might like the fact that you can pretty easily write Action!
externals. Note however, the main program is pretty big (30-40k) and takes
up to 30 seconds to load off of a stock 1050!!! :(:(:(For that, I made
an 'in between'.. I just cut the door menu code out of the main program
(I left it in, actually, so technically I 'copied' it but you can't do that
with the Action! editor ;)), compiled it as an external, and that took about
1/2 or 1/3 the time to load. (Each door said "wanna go to the BBS or the
door menu?" .. so if you go from door to door you don't need to wait SOOO
long in between..)

Anyways.. also, I never tested it at 14.4k :) or 2400.. :) or 300 for that
matter, but I know it'd work that 'fast'. :)

I'm babbling..

back to Windows <cry cry cry> (I should really just make a GIF of the
Atari character set and convert it to BMP rather than DRAWING IT ALL BY HAND
WITH A MOUSE!)

oh well, no pain, no gain

: Is this my fault or are GTIA modes confined to even scroll values?

: -Bry

The way GTIA modes worked prevents from odd scroll values...

think that the ANTIC sends to GTIA a streem of bits as in GRAPHICS 8,
but the GTIA gets 4 bits and then sends a color value to the screen. When
you change the HSCROL register, the ANTIC add a delay in the data to the
GTIA, but the GTIA has no way to know this, so it sends it to the screen
in the normal way, probably missinterpreting the data from ANTIC.

Daniel.

4513. Simple banking

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-05 01:35:57 UTC
From: krishna@max.tiac.net
Message-ID: <31s51t$efu@sundog.tiac.net>
Source record: 99179

I'm TRYINg to get going on my Action! banking routines. But I can't even get past the starting gate.

What's wrong with this? It is going through twice for one thing, and it isn't showing the "Bank 1" print. Essentially it banks to bank4 of CPU extended RAM. Now, I'm not sure just what mode to use (On a stock XE) but I thought cpu mode would be best since we'd be using this space for program space so we want the screen to remain unaltered. Thus 256-64 = turning off bit 4.

Here is my simple test program:

```
SET 14=$2000
SET $491=$2000

Proc Main()

Poke($D301,$FF)
PrintE("In Main Bank now")
Poke($D301,256-16)
PrintE("Bank 1")
Poke($D301,$FF)
PrintE("Back to Main Bank")

RETURN
```

From: MIS0160@MVS.UDEL.EDU
Message-ID: <19940805090117MIS0160@MVS.UDEL.EDU>
Source record: 99191

I purchased a used Indus GT disk drive. Unfortunately, no manual came with it. On the rear are 4 switches. The first two set the drive number. OK so far. The third is for single or double density. All my disks so far are in single or 1050 enhanced format. I would like to copy files to double density using MYDOS. I assume that I will have to flip the switch to double density to format and copy files to the Indus. My question is, do I have to flip the switch back to single to read single or enhanced density disks or can it be left on double all the time and it'll read in whatever density the disk happens to be formatted in? Oh yes, what's the fourth switch for? I can't recall what it's called.

You didn't HAVE to wait for the R:P: to run a fast BBS. I ran BBS
Express Pro with 60megs and a 14.4 Hayes on an MIO for some years. You
could also use a Black Box.

But, I wouldn't worry about showing IBMers anything. If you enjoy using
your machine, that's all that's important. You don't have anything to
prove!

Source record: 99186

In a message dated 8-4-94, William Kendrick said:

"Why don't TVs/monitors come PREMADE like that!? (with
sheilding)"

Simple: To keep the cost down, especially in the case of televisions, where most people would never notice the difference between one with shielding and one without. In the case of monitors, current systems with internal drives seem to be more immune to such interference. However, I would not be surprised to find shielding of this type in low ELF/VLF emission monitors.

In a previous article, MIS0160@MVS.UDEL.EDU (Roger Cole) says:

>I purchased a used Indus GT disk drive. Unfortunately, no manual came
>with it. On the rear are 4 switches. The first two set the drive
>number. OK so far. The third is for single or double density.
>All my disks so far are in single or 1050 enhanced format. I would
>like to copy files to double density using MYDOS. I assume that I
>will have to flip the switch to double density to format and copy
>files to the Indus. My question is, do I have to flip the switch
>back to single to read single or enhanced density disks or can it be
>left on double all the time and it'll read in whatever density the
>disk happens to be formatted in? Oh yes, what's the fourth switch
>for? I can't recall what it's called.
>

No! Just leave the SD/DD switch on the DD setting and get a good dos like MyDos
and you can select the drive density from DOS. The drive will also
auto-sense the denisty at boot up so you dont have to worry about
what density your boot disk is.

The 4th switch is the 'aux' switch, i heard it could be used for some kind
of testing (like a rana?) but have never messed with mine.

4532. PC and Atari in the same screen.

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-05 17:19:50 UTC
From: vparada@inf.utfsm.cl
Message-ID: <31tsbm$5i0@tuetue.inf.utfsm.cl>
Source record: 99202

Hola mundo.

I want to place a PC and an 8bit on the same desk.
Problem: space... the desk is small.

One solution is to remove the "monochrome monitor" (14" B/W TV set)
for the Atari and connect the 8bit to a video-blaster-like card on
the PC, to display Atari screen in a window (or full screen), just
like any other VCR or camera connected to a PC.

Doing this, a null modem cable should be used to transfer files
between computers while the moitor displays the 8bit screen in
one window and Norton Commander's TERM90 or some other communication
software in other window (using Microsoft Windows 3.1).
Can this be _really_ done? I don't know about video cards and
applications to use them, but some problems to share CPU should
appear, I guess...

Also, can SIO2PC software run on Windows, to do the same?

Does someone tried this before?

Thanks... Bye... ++Vitoco

PS: I forgot Atari sounds! Would this also require a sound card
on the PC?

Look for PRO BBS (Exprss BBS PRO)

> Sorry, my software needs a 130XE, BASIC XE, MIO, SpartaDOS X, and an RTIME8.

Well wat is the name of that BBS program ?
And is there a PD version so I can take a look or my USERS can take a look
at it....

Well my BBS (See below) is running on :

1 800 XL
1 BlackBox
1 TKR 14.400 baud modem
1 140 MB harddisk
and PRO BBS version 3.1d under Spartados 3.2d with RTIME8

And about 2 or 3 years a go it run on only : 1 105 Happy drive and a
1050... Well you than have no must space but it is possible....

So if you like to see my BBS call to it... See below.....

The name of the software is "Magnum Opus BBS". It is not currently public
domain at the present time but this could change and it is also not for
sale. The current thought is that it is too theme specific to be a
general use system. Recommended knowledge for this program would be at
least intermediate 6502 M/L, expert SpartDOS X, and expert BASIC XE
programming skills.

I think it is Western Digital (also known for the floppy controller
chips). If you are planning on an Atari 8-bit hack, realize it isn't
plug and play, it requires pin reassignment and tri-state buffering.

Guido Lehwalder asked if there was a way to get the FidoNet Atari 8-bit Echo into Germany. There are already nodes with the echo in France, Italy, Sweden and the Netherlands (I believe)--so it's "on the continent." I'll dig around and see if I can get a node list for the European Zone. We also have Australia and New Zealand actively participating on the FidoNet 8-bit echo as well.

What are the odds of porting a program that is designed for Pokey over to the SID chip? I know the mod conversion is one thing, but the playing routines would be very different.

: drives on the 8-bit? There are programs for other computers that tell you
: the
: access rate, and Data Rate (Eg, my MegaSTE is 550K a sec) I would suspect the
: 8-bit to be... 8K a sec? Hmmm....

There is a data rate, and a throughput rating. Data rate is higher than
throughput due to the tracking of the drive and the vagaries of the DOS.
The data rate has to be well over 100K, but despite that, stuff like
Sparta still takes about 3 seconds to load (16K worth) and init. 64K
writes take about 4-5 seconds (Snapshot). This varies depending on the
drive. Chaching drives do speed things up somewhat. The port can do a
lot more than the DOSs can do. Even ramdisks lag due to the Atari I/O
method. It's a flexible system, but not the fastest.

4543. Info on XE Game System wanted

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-06 06:14:27 UTC
From: sydtech@winternet.com
Message-ID: <31v9o3$ol1@blackice.winternet.com>
Source record: 99060

I just picked up one of these things at a thrift shop (including a light gun and keyboard). What are the difference between this and a regular XL? How much memory does it have? I know it's got Missile Command built in, and I reset it holding down a key (Start?) and got BASIC. I also managed to get the self-test stuff that is identical to my 1200XL. One weird thing I did notice: I have a game where the text loader screen does a brightness cycle. This works OK on my 1200, but didn't seem to be working on the XE.

Anyway, hints and general info would be appreciated.

Thanks,
Scott

I've connected an Atari 8-bit to an IBM via capture software/hardware (a $500 setup) and it worked o.k.. (damned thing really needed 60fps! :) MegaBlast (the game) was too jerky!)

As for getting the files over, well, just connect via SIO2PC. I heard (in the SIO2PC docs) that since MSWindows "checks up" on programs, it made the transfers via SIO2PC in Windows putter quite a bit. <sigh> I know how that is (Windows' incessant "what's going on!? >:^| " it does to MSDOS programs).

As for sound, just plug the Atari sound into your stereo or an amp and some speakers.

THEN what ya need to get is a keyboard switch-box and a Trasnkey, then put your Atari under or in the desk or something and operate the Atari 100% from it's slave machine.. the PC! :)

Imagine that! Better than emulation! The real thing, just clinging with octopus like arms (cables) into the IBM's world! Heh heh heh. >:^) Devilish thought!

Itay Chamiel was telling me about an SVGA montior which can be used as a TV (without an IBM.. just hook it up to cable or video-in or something I guess!) That'd be nice. 60fps versus having to be piped in through a port and thru Windows and back out thru the VGA card and FINALLY to the screen! UGH! :)

-bill
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu

GOOD LUCK! Tell us how it all works! And for gods' sake, get an SIO2PC! :)

4546. SIO2PC problems.

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-06 09:09:20 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <31vk00$fii@nic-nac.CSU.net>
Source record: 99062

Ok.. I've had this problem before a little bit, but OH you should hear it NOW!
Ok.. I have my SIO2PC cable very close to my modem (right above it.. now on
a nice 'case' made out of wood on which the thing is bolded and nailed down..
that's tied with string (for now) to my modem because the thing is so light
that the SIO cable part wriggles it around from the angle I want it at! :))
and when I'm using the modem, and not the SIO2PC (I only have one damned work-
ing COM port so they have to share :^( ) I get HELLA noise and errors when
trying to boot my 1050.

Now, this is fixable by unplugging the SIO part of the SIO2PC, or by plugging
in the RS232 part if I get noise when not using the modem.

I'm just wondering, though, how else can I fix this? The cable is by no
means sheilded. It's like this:

RS232 25-pin plug
5-wire long ribbon cable
Mish-mash of circuitry (the board)
SIO cable (a pre-XL looking Atari one at that! :))

Should I wrap the thing in something? What I guess it's doing is picking up
the data going between my (new 14.4k .. sounded a lot less messy when it was
my 2400) modem and my PC and screwing up the 19.2k bps (right?) SIO trans-
missions on my SIO line.

Man I need a quintopus! :) (My XMM801, well, it's dead, but before that
one of the ports got umm .. torched, shall we say?) (My 1200XL has obviously
only one) (My SX212 (which won't work with my 256k XL .. needs a new PIA
chip in there.. I've got one, but no good soldering equipment with which to
disconnect and reconnect the 256k upgrade) has only one) (My other 1050
seems to have a slightly screwed up SIO port (this must have happened when
I blew out my XMM801, my POKEY and PIA, and maybe even the SIO port in my
SX212! <sigh>))

Does anybody know the specs on the R:P:Connection? Will it have 2 SIO
ports or an SIO cable? Will it need an extra power input? Does it have
on-board R: handler? (I think I heard 'yes') Etc. etc. etc.!

Thanx!

Speaking of tricks...

Amazingly enough, there are methods of having banked memory and not
losing ANY bits or Antic Banking for that matter...

I wouldn't have even considered going to 4mb, if the machine would
have to be crippled in ANY way.

More on this later, as the MARS 8 will be fully documented in the
up coming catalog from FTe.

>MARS8 stand out as being exclusive or unique. FTE has been rather

>but this is only speculation, and barring any interesting info it doesn't
>really prove to "hype" the system to create demand.

The reason for the close-lippidness, is to eliminate the need for
"hype". The MARS 8 will simply have to stand on it's own two feet
after release, and FTe is just making sure that it has a great pair
of hiking boots!!

>accessed. I assume they are doing something innovative in both domains,

I can only hope so... Being truly innovative depends not only on
whether a product is or not, It's really up to the end-user to decide...

I mean, how much time and effort was put into developing Pet Rocks??

The MARS 8 has been a back breaker, and yet somehow I doubt if it will
go the same way as the hoola hoop... <grin>

Oh well, There's always that NEXT project!! Mike

4551. The 14xxXL Series

Money. Everything costs money. And most people shop for the cheapest item which will do the job, so manufactuors have an incentive to cut costs to the bone.

I'd be real careful running SIO2PC under Windows. On my
486/33 it just isn't workable; lots of timeouts and errors.
Even if I set the DOS Box settings to exclusive, max out
the timeslices and run it full screen. OS/2 would be better
I guess.

Here's a thought. Does anyone have the SIO2PC source? How
about a Windows specific version? Drag and drop disk images?
I like it already.... :)

Try a resistor from pin 2 of the DB25 connector to pin 7 of the
DB25 connector, about 10 K ohms or so, and leave it connected all
the time. If using a DB9 connector, from pin 3 to pin 5.

This may help, if the noise is getting into the 232 converter
front end or if the open line causes the signal to float to close
to the noise threshold.

In addition to the pin 2 (3 on DB9) resistor, a resistor on pin 4
of the DB 25 (pin 7 of the |DB9) to pin 7 (pin 5) of about 10 K
would dampen noise floating. (for the RTS line).

if all else fails, a switch on the lin to pin 3 of the SIO plug
would open the line.

Most good upgrades at least have an Antic banking fallback that usually
kills some of the upgrade. Or it will have enough bits to let you do
SOME ANtic banking but not a whole meg. Depends on the upgrade.

: : that Atari had out a while ago....I forget the name, Vindicators or
: : something like that. It had a graphic of a rotating planet featured
: : prominently on the screen.

: "Vindicators" was a vertically-scrolling 2 tank game. You would drive
: around and shoot things, pick up stars (which could be exchanged for
: gun power, gun rotation, fuel, etc), and try not to run out of gas.
: It wasn't really flashy, but it was one of those games you can really
: get into. There's a coinop, and a decent version for the NES, but not
: for the 8-bit, I think.

: And no rotating planet, that I remember.

The Last Starfighter is really Star Raiders 2. The original Last Starfighter
name was used because Atari purchased the license rights to it - there is a
movie called Last Starfighter which the game is based on...Starred Lance
Guest, circa about 1984-5. Anyways, the "Last Starfighter" game with the
title and everything was never released in stores (but a copy did leak out and
circulated throughout the world as 'warez')...The game was eventually sold as
Star Raiders 2. Hope this answers your question...l8r

There is no 65832. The design is complete but it is just not in
production. It is similar to the 68060's status, but with the '060 it IS
being made in small quantities.

If Nintendo had decided to continue with the 65xx(x) archetecture I think
the 65832 would be numerous but that is not the case.

I believe other companies have a license to manufacture the 65816 (i.e.,
the G65SC816P-3 in my Apple GS is labeled "GTE") but Western Design
Center is indeed the company that created it, and is likely the best
source for information.

I have an old (circa '87) data sheet on the 65816 from when it was
first introduced, but alas, have no good idea where it is at the
moment.

However, I was able to find the contact info (from a recent post
in the comp.sys.apple2 newsgroup:

I saw a message recently in either the Apple forum on Delphi, or in comp.sys.apple2 about a 658128. Despite the nomenclature, the chip is apparently just a more highly integrated and efficient version of the 65816. Whether the chip is actually slated to go into production, or was simply part of a test batch for use in the machine it was demoed in (a small "palmtop" from the sound of the report), I do not know.

Hanging out around Apple IIgs folk seems to be a good way of picking up 658xx infor. But then, that is not surprising, since they have a more vested interest in that chip family than any other computer owners.

>
>It's got 5khz response, which is the exact same response as a telephone.
>

Hi everybody, just checking in on the digital sound stuff you guys are doing; I'm glad somebody went ahead and made a sound player that takes advantage of banked RAM. Parrot II had this feature and could store up to 86K of sampled sound on a stock 130XE. It had to; the newer digital hardware could sample as fast as the 8-bit could read it, so memory filled up fast.

To answer some questions about sound playback on the ol' 8-bit, the bottleneck resulting in 5K signal response was the computer's built-in analog _input_ circuits, namely the paddle pot readers. They could be programmed to make a reading every two television scan lines, or roughly 10,400 samples per second. The only way around this was to slow down the audio being sampled.

Playback, however, is not subject to this limitation, as you can hear by playing samples at speed 1. At this speed the frequency response is more like 12K, which is pretty good, although this burned through Parrot II's 86K sample length in about eight seconds. I have several samples made with a prototype of the new hardware that sound quite good, although I don't think the final product was ever released.

As far as the Parrot file format limiting the length of samples, this is not true. Just print the byte-length into the header as an ASCII string and you're fine. My doc says the string is 5 to 6 bytes; this is not a rule, just an observation since most Parrot files were less than 100,000 bytes long. Hopefully now that will no longer be the case :-)

'til next time,

Tony

: 65816 are slow (<3MHz) and wondered what this chip could really do. In
: other words, would an updated Atari 800 series machine be better off
: with a 65816 or a faster chip with on-board 6502 emulation?

The problem is that in order to do software emulation of the chpset you need something like 10 times the CPu power of the 6502. That's why PCXformer even has trouble because the VGA system is not designed analogous to the Atari's. Something like a 25mhz Amiga could probably do a better job. I'll be curious to see benchmarks on the XL/XE emulation on the Emplant if they ever do it. So if you want anything to run FASTER than 1.79mhz then you'd have more luck trying to break the barrier with the current archetecture. If video technology had progressed through analog video similar to the Amiga then emulations wouldn't be so difficult.

With that being said, even if you can break the barrier and have an 8mhz 65816, the custom chips must still run at 1.79mhz so you've got the start of an ISA bus kind of problem where the video is holding back the throughput so you won't get full 8mhz throughput in most cases. At least, that's how I see it, so it's hard no matter how you attack the problem.

anthony daniel ramos (aramos@cis.ohio-state.edu) wrote:

: Playback, however, is not subject to this limitation, as you can hear by
: playing samples at speed 1. At this speed the frequency response is
: more like 12K, which is pretty good, although this burned through
: Parrot II's 86K sample length in about eight seconds. I have several
: samples made with a prototype of the new hardware that sound quite good,
: although I don't think the final product was ever released.

44khz is CD quality and you rarely see samples that high. 22khz you see
now and then. 11khz samples you see a lot of. If the Atari can keep up
at 12khz that is passable for most stuff.

Why not let us know what this new hardware is like.

We can always try to convert .WAVs but it's not really possible to MAKE
them convert in such a way that you have to play them at speed 1. If you
don't convert them so that they play at speed 1 then you don't get
maximum quality, plain and simple.

I have to pick up Tom's .QXL info. Maybe we can do somehing.

4581. Odd MIO problem

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-08 15:01:08 UTC
From: kamaro_kid@delphi.com
Message-ID: <BAxyUw8.kamaro_kid@delphi.com>
Source record: 99107

Has the following ever occurred to anybody here??!

I've been using an MIO on a MUX'ed XL for the last several months - mainly just so that machine could have its own hard drive (in addition to the MUX'ed HD), and I was using the MUX'ed printer.

Last night, I decided to hooka printer directly to that MIO..and whamo, the hard drive was no longer accessible.

Unplugging the printer cable from the MIO allowed me to use the hard drive again. How can plugging in a printer on an MIO shutdown the hard drive port?

Mike? You reading this? What can I do? Is your repair facility operational yet?

(Kamaro Kid asks why his MIO won't access the local hd when he hooks
up a local printer.)
I dunno. And risking being dumb, I just sure hope you are turning off
the MIO before you plug/unplug your printer in. I have no experience
with the MUX, but I do know that sometimes the printer interface
goes bonkers on a non-MUXed MIO. You might try seeing if both the
hd and the printer will work WITHOUT the MUX.

4594. Trade *new* Comm II for computer

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-09 05:01:59 UTC
From: electra@DGS.dgsys.com
Message-ID: <Pine.3.89.9408090052.A5883-0100000@DGS>
Source record: 99122
Cross-posted to: comp.sys.atari.8bit,comp.sys.misc

Well "new" is a relative term as these Atari Communicator IIs were manufactured some years ago, but they have never been taken out of the box. Everything is there, like the day they left the factory, including the 835 direct-connect modem, the Telelink II cartidges and all docs. In return, I'm looking for systems from the same era or a little earlier:

Compucolor Interact apf Imagination Machine
Vidoe Brain Sorceror Atari 130XE

If you have something else, please let me know, but nothing of the C= 64, TI 99/4A ilk.

Thanks,
Allan

4595. What about multi-coloured graphics?

I've got to be honest: I always envied C64 and Spectrum users because *many* of their games were so much better than *many* of those for the Atari 8- bits. There were exceptions and these exceptions probably made up for those which obeyed the rule.
Has anyone seen some of the Games for the Spectrum made by the British company called ELITE? There was one called Attic Attack and it was bloody brilliant - *very* colourful and lovely graphics (yes, on a Spectrum!) The nearest thing I found on my Atari was Starquake and as far as graphics was concerned it quite simply was not in the same league as the above mentioned Spectrum games.
I think that the biggest problem with the Atari 8-bit was/is the lack of colours available in the highest resolution text mode - even the Vic 20 could do better!
Yet some of the 8-bit games were brilliant. Compare them to some of the (expensive) ST games available today! Playability seems to have decreased as hardware specs have increased.
I'd be interested to know what other people think about this.

Gareth Davies.

4596. Re: 65816 /32 info

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-09 12:13:35 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <po+wss-.lmcclure@delphi.com>
Source record: 99124

In a message dated 8-8-94, bryedewaard@delphi.com said:

"Sorry to be so redundant. I just noticed that ALL applications
of the 65816 are slow (<3MHz) and wondered what this chip could
really do."

Not ALL of the applications are slow. Accelerators for the Apple IIGS start out at 6Mhz (the original AE TranswarpGS), and go up to 9MHz (the fastest stock model of the ZIP GS accelerator in my last issue of A+). Evidently, until this very month, the fastest production 65816's available from Western Design were 10Mhz. However, according to news on the net, the first run of "production" 14Mhz 65816's is now in the works. If you would like to order one, price is reportedly only $19.80, but the minimum order is $100. I do have information on a fellow who is accepting single orders for them for $30 each, however.

"In other words, would an updated Atari 800 series machine be
better off with a 65816 or a faster chip with on-board 6502
emulation?"

Given how much emulation of another chip's architecture slows down even the speediest CPU, and the price of REALLY fast CPU's, which do you think?
